ROGER I., Count of Sicily and Calabria, and the founder of the Norman dynasty in these countries, was the youngest of the twelve valiant sons of Tancred de Hauteville, and was born in Normandy about 1031. Hearing of the wondrous success of his brothers (see **GUISCARD**), who had some time before departed to follow their fortunes, and had by this time gained possession of the greater part of southern Italy, Roger set out in 1058 to join them. On his arrival, he was deputed by his brother Robert to conquer Calabria, an achievement which was speedily executed. In 1060 he set out on an expedition against Sicily, then ruled by a number of Saracen chiefs; but he confined himself in this and the following expedition to predatory attacks on Messina and its neighborhood. He then took and fortified Messina, making it the base of his future operations, and being joined by Robert, the two, at the head of their small band, performed a variety of almost miraculous exploits. They were gradually joined by the Christian inhabitants, especially when their success had given the latter room to hope for freedom from their Moslem masters; and in 1072, Palermo, the capital and chief stronghold of the Saracens, was yielded to the invaders. Roger was then invested by his brother with the crown of Sicily, under the title of count; but it was not till 19 years afterward that he succeeded in thoroughly supplanting the Saracens, owing to the repeated re-enforcements they received from Africa. Roger had previously divided the country into fiefs, which he now distributed among his chief barons, whose relations to their subjects were regulated by him with justice and moderation. He had, in 1062, received from Robert his fair share of Calabria, to which, on the death of the latter, he added (1085) a number of towns wrested from Roger and Bohemond, Robert's two sons. He was now the chief of the Hauteville family; and the fame of his exploits, and the greatness of his power, made his alliance be courted by the first princes of Europe. It was at this time he took the title of "grand count," to distinguish him from his vassals; and in 1098, he received from pope Urban II., in recompense for his fidelity to the holy see, the privileges of refusing at his pleasure papal legates admission to his territory, and of appointing bishops. The last acts of his life were the building and endowing of churches and monasteries, among others the cathedral of Messina (1097). He died at Mileto in Calabria, July 11, 1101.

ROGER II., King of Sicily, second son of the preceding, was b. in 1097, four years before the death of his father. His elder brother Simon having died in 1102, he became the heir to the Sicilian throne; and during his minority, the government was administered by his mother, a princess of Montferrat. When Roger had taken the supreme authority into his own hands, his first care was to extend his estates. He compelled his cousin William to yield up the portions of Calabria and of the town of Palermo which Robert Guiscard had withheld from his father: and after the death of William (1127), he took possession of Apulia itself, obtaining his investiture in these new possessions (which were fiefs of the holy see) in the following year from Honorius II., who added to them that of the duchy of Naples. Ambitious of the title of king, he supported the faction of pope Anacletus, his wife's brother, and received from him the title of king of Sicily, with rights of suzerainty over the duchies of Naples and Capua—the former being a Lombardo-Italian, and the latter a Norman principality. In return, Roger established Anacletus on the pontifical throne in 1130; but the dispossessed pope, Innocent II., and the exiled princes of Capua and Naples, applied to the emperor Lothar, who stripped Roger of many of his acquisitions—the latter, however, recovering them almost the moment the German army had retired. At last, his bitter enemy, Innocent II., fell into his hands in 1139, and was compelled to withdraw the excommunications he had pronounced against Roger, and to consent to his retaining the territories he had acquired (excepting Naples), obtaining by these means not only his liberty, but the firm attachment of Roger to the holy see, and his own recognition as lawful pope. In 1141 he received from pope Lucius II. the right of using the staff, ring, tunic, miter, and other symbols of ecclesiastical dignity and power. In 1146 he revenged himself on the Greek emperor, who had been of the league with the pope and the emperor against him, by capturing Corfu, and pillaging Cephalonia, Negropont, Corinth, and Athens, returning to Sicily with an immense booty, including a number of workers in silk, by whom the silk-manufacture was first introduced into Sicily. He followed up these successes by the taking of Tripoli and other places on the African coast, and afterward attacking the Zeirides—leaving, at his death, an African dependency which stretched from Morocco to Kairwan. He died at Palermo Feb. 26, 1154. Roger was, like his father, prudent and resolute, skillful both in the cabinet and on the field; but he had neither the fine deportment nor the generous soul of the first Roger. His mind was capable of great scope and untiring energy, so that the real interests of his states were never overlooked, and the orderly system of taxation and government was a pattern to the rest of Europe. He cared nothing for the religion of his subjects—they might be heathens if they chose; but obedience to himself and respect to the laws were rigorously demanded and enforced. His fleet was supreme on the seas, and his court surpassed in magnificence that of every other prince in Europe. He spent many of his later years in rearing religious edifices on a scale of extreme magnificence, of some of which remains still exist.

ROGERS, HENRY, educated at Highbury for the Independent ministry, became professor of English literature in University college, London; resigned that post on his appointment to a theological professorship near Birmingham, and was appointed principal of the Lancashire Independent college in 1858. *The Eclipse of Faith* is his best-known book. *Reason and Faith* was published in 1866; *The Superhuman Origin of the Bible inferred from Itself*, in 1874. Rogers died Aug. 20, 1877.

ROGERS, HENRY DARWIN, LL.D., 1809-66; b. Philadelphia; professor of physics in Dickinson college, Carlisle, 1831; afterward for several years professor of geology, university of Pennsylvania; published, 1835, a report and geological map of New Jersey, and final report 1840; occupied in the survey of Pennsylvania 1836-56, and published annual reports, the last in two vols. 1858; appointed by the crown regius professor of geology and natural history in the university of Glasgow 1857, and chosen fellow of the Royal society of Edinburgh. He contributed many important papers to the *Transactions* of scientific associations, to the *Journal of Science*, and to the *New Philosophical Journal*, of which he was one of the editors; prepared a chart of the arctic regions in the *Physical Atlas*; and a geological atlas of the United States, with W. and A. K. Johnston of Edinburgh.

ROGERS, JAMES BLYTHE, 1803-52; b. Philadelphia; studied medicine at the university of Maryland. He held at various times the chair of chemistry at the Washington medical college in Baltimore, the Cincinnati medical college, the Franklin medical school in Philadelphia, and the university of Pennsylvania. He was assistant in the chemical and geological surveys of Virginia and Pennsylvania; published many scientific papers, and edited, with his brother, Robert Empie, Turner's *Chemistry*.

ROGERS, JOHN, 1505-55; b. England; was educated at Cambridge; ordained and appointed chaplain to the English merchants at Antwerp, remaining there several years. Meeting there Tyndale and Coverdale, he was led to renounce popery; became pastor of a Dutch church at Wittenberg. On the accession of Edward VI. he returned to England in 1548 by invitation of bishop Ridley, and became rector of St. Margaret Moyses and St. Sepulchre, in London, in 1550; in 1551 was made prebendary of St. Paul's, St. Pancras, and rector of Chigwell, and later, divinity reader. On the Sunday after the entrance of queen Mary into London in 1553 he preached at St. Paul's Cross, denounced popery, and urged upon the people a steadfast adherence to the doctrine's taught in king Edward's time. Summoned before the privy council, he ably defended himself and was released; but Aug. 18 he was ordered to remain a prisoner in his own house; after six months was removed to Newgate and treated with great severity. Jan., 1555, he was tried before Gardiner, bishop of Winchester, and condemned to be burned at Smithfield, Feb. 4. He compiled the first authorized English Bible, prepared from Tyndale's MSS., and Coverdale's translation, which was published under the name of Thomas Matthew: *The Byble in which is contained the Olde and Newe Testaments*, etc., by Thomas Matthew. Copies of it printed by Grafton and Whitechurch are in the British museum. In Fox's *Martyrology* are found an account of his examinations written while in prison, and other papers.

ROGERS, JOHN, 1565-1630; b. England; a Puritan; vicar of Hemmingham 1592; minister of Haverhill 1603. His publications were: *Sixty Memorials of a Godly Life*; *A Treatise of Love*; *The Doctrine of Faith*; *A Godly and Fruitful Exposition upon all the First Epistle of Peter*. These works were highly valued by the English Puritans. His son Nathaniel, educated at Cambridge; preached at Bocking and Assington, but was forced by persecution to leave for New England, where he was settled at Ipswich, Mass. He published a *Letter Discovering the Cause of God's Wrath against the Nation*.

ROGERS, JOHN, b. Salem, Mass., 1829; began life as a dry-goods clerk in Boston; went on a voyage to Spain; studied civil engineering, learned the trade of a machinist, and took charge of a railroad repair-shop at Hannibal, Mo., 1856; and modeled in clay. He went to Europe in 1858, returned in a year to Chicago, and entered a surveyor's office as draughtsman. In the same year he produced his "Slave Auction," and placed it on exhibition in New York. It at once caught the popular fancy and success was assured. His small groups in gray clay, illustrating scenes of the late war and rural incidents of a former period, have gained him great celebrity. He has a studio in New York, and has recently turned his attention to anatomical studies in the interest of art, and to garden and lawn statuary.

ROGERS, NATHANIEL PEABODY, 1794-1846; b. New Hampshire; graduated at Dartmouth college in 1816; studied and practiced law, but abandoned it in 1838 to edit the *Herald of Freedom*, an anti-slavery periodical, at Concord. He wrote for the *New York Tribune*, under the pseudonym of *The Old Man of the Mountain*. A volume of his fugitive pieces was published at Concord in 1847.

ROGERS, RANDOLPH, b. New York, 1825; studied art in Rome, where much of his life has been spent. Among his earlier works are his "Boy and Dog," and his statue of "Nydia, the Blind Girl of Pompeii." He designed the bronze door at the e. entrance of the rotunda of the capitol at Washington, finished Crawford's designs for the Washington monument at Richmond, and designed soldiers' monuments for the states of Michigan and Rhode Island. Among his works are statues of Ruth and Isaac, and a bronze statue of Lincoln at Philadelphia.

ROGERS, RICHARD, 1550-1618; b. England; preached as a Puritan minister in various towns of the kingdom for about 40 years, and held a high rank for his talents and his successful labors. He published *Seven Treatises*, a work greatly valued by Hooker and other ministers of New England.

ROGERS, ROBERT, 1730-1800; b. Dumbarton, N. H.; descendant of Irish pioneers. In 1755-63, during the French war, he was the daring leader of the famous Rogers's rangers. In 1758 he fought a bloody battle with the French and their Indian allies; his 170 men against 100 French soldiers and 600 Indians. When he was forced to retreat the French loss numbered 150, the American 100. In 1759, dispatched by gen. Amherst, he destroyed the Indian village of St. Francis, Indian loss, 200. In the following year he captured Detroit and other French posts, and went to England, published his journal, and was appointed gov. of Michilimackinac 1765. While holding that position he was arrested on suspicion of treasonable practices, and court-martialed in Montreal. In 1769 he went to England and thence to Algiers, and fought under the dey. During the revolutionary war he was twice arrested, and twice released on parole, dishonored his parole and recruited a company in the British army, called the queen's rangers, which he carried through the war. He published journals and reminiscences of the war.

ROGERS, ROBERT EMPIE, b. Baltimore, 1814, studied medicine at the university of Pennsylvania. In 1844 he was called to the chair of chemistry at the university of Virginia, where he remained till 1852, when he took the same position at the university of Pennsylvania, succeeding his brother, James Blythe. Soon afterward he was made dean of the medical faculty. He edited, with his brother, Turner's *Chemistry*, and has also edited Lehmann's *Physiological Chemistry*.

ROGERS, SAMUEL, an English poet, was b. in London, July 30, 1763. His father was a banker and member of a dissenting body. After having been carefully educated, Rogers was placed in his father's bank. His taste for literature and the company of literary men awoke at an early period, and he, accompanied by a friend, went one day to call on Dr. Johnson, who was then living at Bolt Court, but his courage failed him when his hand was on the knocker. In 1786, he published his first book, entitled *An Ode to Superstition, and some other Poems*. In 1792 he published his *Pleasures of Memory*—the work on which his fame most securely rests. For a considerable period after this he was silent. Meanwhile, he had retired from business, and in the possession of ample wealth, in his house in St. James's place, he employed himself with his muse, his cook, the company of the literary celebrities of his time, and the collecting of pictures and articles of *virtu*. Then, and during the whole period of his subsequent life, his breakfasts were more famous than his poems. Critics might find fault with the one, but not with the other.

In 1812 he published *Columbus*, a not very striking poetical fragment. In 1814 *Jacqueline* appeared in the same volume with Lord Byron's *Lara*. In 1819 he issued *Human Life*; and in 1822, *Italy*. An edition of the last work, illustrated by the best artists, at the cost, it is said, of £10,000, appeared in 1836. After this date he published nothing—his time being mainly devoted to taste, dining, epigram, and anecdote. Although aged, he was a greater gadder about than any man of his years in London. He rode or strolled in the parks, he haunted picture-galleries, he was a constant attendant at the opera. He was by far the oldest English poet. An accident in the street at last confined him to his room, and on Dec. 18, 1855, he died, aged 93. He read Goldsmith's *Traveller* when it was published, and he might have read Tennyson's *Maud*. He published his first book before Burns's first volume appeared at Kilmarnock. Since his death Rogers's *Table Talk* has been published.

ROGERS, WILLIAM BARTON, b. Philadelphia, 1805, son of Dr. P. K. Rogers, brother of Dr. James Blythe, and Dr. Robert Empie; graduate of Harvard university, 1826. In 1827 he gave scientific lectures in the Maryland institute, and two years subsequently, on the retirement of his father, accepted the chair of natural philosophy and chemistry in William and Mary college. Of those sciences and that of geology he was prof. 1835-53, in the university of Virginia; and in the latter year removed to Boston. In 1835-42 he was at the head of the geological survey of the state of Virginia, which he organized, issuing reports in 6 volumes. He is an earnest promoter of scientific education among wage-workers, has contributed many valuable essays to the popular scientific journals, and has read lectures on special subjects before societies and institutes. He was president of the Massachusetts institute of technology, in Boston, 1862-68.

ROGET, PETER MARK, 1779-1869; b. London; studied medicine at the university of Edinburgh, and removed to Manchester, where he became physician to the lunatic asylum, the fever hospital, and the infirmary. He settled in London in 1808, and was long the secretary of the Royal society. Among his works are *Animal and Vegetable Physiology*, 1834; and a *Thesaurus of English Words and Phrases*, 1852. The last, which he deemed a minor work, has been found very useful.

ROGUE-MONEY is, in Scotland, an ancient assessment which the freeholders of every county at any of the head courts directed annually to be made in such sums as they judged necessary for defraying the expense of apprehending offenders, subsisting them in jail, and prosecuting them. The functions of the freeholder in the matter were trans

ferred to the commissioners of supply by 2 and 3 Will. IV. c. 65, s. 44. The tax was first appointed by a statute of 11 Geo. II. c. 28. The raising and application of the tax are not uniform in the various counties.

ROHAN-GUÉMÉNÉE, LOUIS RENÉ ÉDOUARD, Prince de, 1754-1803, b. France; bred to the church, and made ambassador to Austria in 1772. He was recalled in 1774, having become offensive to Maria Theresa by his meddlesome spirit and the scandal caused by his luxurious mode of life. He became cardinal in 1778, and bishop of Strasburg the next year. He was imprisoned 1785-86 for his participation in the affair of the diamond necklace, and on his release was dismissed from court in disgrace. He was a deputy to the states-general in 1789, but resigned on account of accusations of disloyalty. He resigned the bishopric of Strasburg in 1801.

ROHILOUND, an extensive region in the n.w. provinces of India, lying w. of Oude, and named after the Robillas, an Afghan tribe which migrated hither in the 18th century. As an administrative *division* (area, 11,805 sq.m; pop. '72, 5,436,314) it comprises the districts of Bijnur, Moradabad, Bareilly, Budaon, Shahjehanpur and Terai, and the protected state of Rampur.

ROHLFS, GERHARD, b. at Vegesack, near Bremen, in 1834; studied medicine at Heidelberg, Würzburg, and Göttingen; went to Algeria and entered the foreign legion of the French army. Having learned the Arabic language, he went in 1861 to Morocco, which he traversed, exploring the course of the wady Draa; traveled again in Morocco in 1864, and after a visit to Germany in 1865 he returned to Africa, spending two years in his travels. He received the medal of the Royal geographical society of London. In 1867, by order of the king of Prussia, he joined the English expedition against Abyssinia, and in 1873 he went with a party to explore the Libyan desert under the patronage of the khedive of Egypt. He visited the United States in 1875, and lectured on his travels. He has published several books of travel.

ROHTUK, a t. of British India, the capital of the district of the same name, in the division of Hissar, Punjab, 42 m. n.w. from Delhi. A canal or water-course, 45 m. long, constructed by order of the British government in 1825, supplies Rohtuk and the neighboring country with water from the great Feroze-shah canal. Pop. '68, 14,153.

ROKITANSKY, KARL, 1804-78; b. Bohemia; studied medicine at Prague and Vienna. In 1844 he was appointed professor of pathological anatomy at the university of Prague of which he became honorary rector in 1848. He was made rector of the university of Vienna in 1850, and resigned his professorship to 1874. His chief book is *Handbuch der pathologischen Anatomie* (1842-46). He was considered one of the first authorities on pathology.

RO'LAND, the hero of one of the most ancient and popular epics of early French or Frankish literature, was, according to tradition, the favorite nephew and captain of the emperor Charlemagne. All that history tells us of him is simply this: In 778, when Charlemagne was busily engaged at Paderborn in organizing the government of the recently subjugated pagan Saxons, and superintending their collective baptism and formal admission into the Christian church, he was visited by a Saracen chief, who, being unwilling to recognize the supremacy of the calif of Cordova, offered to put the Frankish sovereign in possession of several towns s. of the Pyrenees which were under his rule. Charlemagne, accepting the offer, marched with a numerous army through the territory of Gascony, whose duke, Loup, he constrained to do him homage, and took Pampelona and Saragossa. Finding, however, that his Saracen ally gave him but little aid, he turned back to return to France; and it was during this retreat, while the Christian army was slowly threading its way through the narrow valley of Roncevaux or Roncesvalles (q.v.), that Roland, commander of the marches of Bretagne, who commanded the rear-guard, was suddenly attacked by a large body of Vascons, lying in ambush in the surrounding woods, and slain while fighting gallantly. Beyond these meager details, all that we read of Roland is traditional. The oldest version of the *Song of Roland*, forming part of the *Chansons de Geste*, which treat of the achievements of Charlemagne and his paladins, belongs to the 11th c., although it is probable that the original compositions are not much later than the period to which they refer. Throughout the middle ages the *Song of Roland* was the most popular of the many heroic poems current, and William of Normandy, when on his way to conquer England, had it sung at the head of his troops, to encourage them on their march; while at the present day the traditional memory of the heroic paladin is still held in honor by the hardy mountaineers of the Pyrenees, amongst whose dangerous defiles the scene of his exploits and death is laid. According to the poem, Charlemagne had been six years in Spain, when, resolving to return to France, he, by the advice of Roland, sent his captain, Ganelon, on an embassy to the pagan king Marsilius of Saragossa, to receive the homage which he had pledged himself to perform. The mission was a dangerous one, as all other ambassadors to the king had been slain, and Ganelon, wishing to revenge himself on Roland, proved a traitor, and betrayed to Marsilius the route which the Christian army were to take. The consequence was that, after Charlemagne had safely crossed the mountains with the main part of his forces, Roland, who commanded a rear-guard of 20,000 men, was surprised within the narrow valley of Roncesvalles by a terrible army of all the pagan

nations of the world. Roland, who possessed an enchanted horn which could have been heard far beyond the mountains, might have recalled his uncle, but despising such pusillanimity, he fought on till 100,000 Saracens lay slain around him and the 50 warriors who alone remained alive to aid him. Another army of 50,000 men of Carthage, Ethiopia, and Candia now pours down upon him. At length he blows his horn, which is heard by Charlemagne, who, however, does not return, as Ganelon persuades him once, twice, and thrice that Roland is only hunting the deer; and not until the veins of Roland's neck have burst with the violence of the blast does the emperor retrace his steps. In the mean while Roland has dragged his dying limbs to the foot of Mt. Cisaire, above Roncesvalles, where, after having sung his death-song and thrown his trusty and enchanted sword Durandal into a poisoned stream, where it still remains, he dies exhausted from his many wounds. Charlemagne, who arrives too late to save him, avenges his death in a series of marvelous battles and bloody victories, whose delineation imparts a sufficiently dark coloring to the closing passages of this somber epic.

ROLAND DE LA PLATIERE, JEAN MARIE, a French minister of the revolutionary period, was born at Mizy, near Villefranche (Beaujolais), Feb. 18, 1734. His first independent appointment was that of inspector-ordinary at Amiens. In 1775, at the house of a friend in Amiens named Sophie Cannel, he met Marie Jeanne Philpon, a young woman of brilliant genius and fascinating beauty, and after a courtship of four years, they were married Feb. 4, 1780. When the revolution broke out in 1789, Roland, as well as his wife, became a decided partisan of the movement. In 1791 he was sent to Paris, by the municipality of Lyons, to represent to the constituent assembly the deplorable condition of the Lyonnese weavers. After the dissolution of the constituent assembly, he founded at Lyons the *Club Central*, the members of which, marked by their attachment to constitutional liberty, received the name of *Rolandins*. Toward the close of 1791 he fixed himself at Paris, and soon became one of the heads of the Girondist or moderate section of the republicans. In March, 1792, he was appointed minister of the interior, a situation which he held till Jan., 1793, when he resigned it, despairing of seeing moderate counsels adopted. After placing his accounts in the hands of the assembly, he asked permission to withdraw from Paris, but it was refused, and an illegal attempt was made to arrest him, which failed. Immediately after, he fled, and concealed himself in Rouen. When news reached him of the execution of his wife, he committed suicide at a small village in the environs of Rouen, Nov. 15, 1793. Roland wrote and published several memoirs and disquisitions on branches of industry, besides 6 vols. of *Letters* addressed to his wife before their marriage, from Switzerland, Italy, Sicily, and Malta.

ROLAND, MADAME (*née* MARIE JEANNE PHILPON), wife of the preceding, was the daughter of Pierre Gratien Philpon, an engraver, and was born at Paris, March 17, 1754. The precocity of her intelligence was remarkable. At the age of four, she had quite a passion for reading; at seven, she learned by heart a treatise on heraldry; at eight, she used to carry Plutarch with her to church, while the *Jerusalem Delivered* of Tasso, and the *Telemaque* of Fenelon fired her childish imagination. At the same time an ardent piety began to develop itself, and when only 11 she entered the *Maison des Dames de la Congrégation*, in the Faubourg Saint Marcel. Here she formed a close friendship with two young girls from Amiens, Henriette and Sophie Cannel, particularly with the latter, which was fruitful in consequences. On her return to her father's house after the lapse of two years, "a change came o'er the spirit of her dream." She no longer cared for the so-called "religious" writers—the defenders of the Bible and the church. Her faith was slowly changing from the dogmatic creed of Bossuet to the "naturalism" of the encyclopédists and "philosophes." In ethics, now as ever, her preference for the stoical system was marked. Shortly after the death of her mother in 1773 she read for the first time *La Nouvelle Héloïse*, which seemed to her (as it has to many another young impassioned soul) a veritable revelation. Greatly distressed by the imprudent conduct of her father, she again withdrew, at the age of 25, to the *Maison des Dames de la Congrégation*, and once more attempted an "austere" life; but M. Roland (q.v.), who had already known her for five years, now came forward, and rescued her from a career which must ultimately have proved equally unsatisfactory to her reason and conscience, by offering her his hand. She was 25, and he 45. There was certainly something unpoetical in the disparity of their years, but then, Mlle. Philpon knew that "ideal" matches were made only in heaven, and so she accepted calmly the inspector of manufactures. Their marriage was celebrated Feb. 4, 1780. It is unnecessary to follow the remainder of her career, which was of course identical with her husband's until his flight from Paris May 31, 1793. The same night she was herself arrested, and imprisoned in the Abbaye. A more dauntless and intrepid spirit never entered its walls! Released on the 24th of June, she was instantly rearrested by the very commissaries who had set her at liberty, without the shadow of a tangible accusation, and confined in Saint Pelagie. Madame Roland spent the period of her imprisonment in study, in the composition of her political *Mémoires*. Summoned before the revolutionary tribunal in the beginning of Nov., she was condemned, and on the 9th was guillotined, amid the shoutings of an insensate mob. It is said that while standing on the scaffold, she asked for a pen and paper that she might "write down the strange

thoughts that were passing through her head." Only a genuine child of the French republic could have been so ostentatiously speculative at such a moment. Still more celebrated is her apostrophe to the statue of liberty, at the foot of which the scaffold was erected: "O Liberty, what crimes are committed in thy name!" or, according to another version, "Liberty, how they have played with thy name!"—See *La Correspondance de Madame Roland avec les Demoiselles Canuet* (2 vols. Paris, 1841); *Lettres Autographes de Madame Roland, adressées à Bancal des Issarts* (Paris, 1835).

ROLETTE, an unorganized co. in n. Dakota, adjoining British America; about 1800 sq. miles.

ROLL, a round molding much used in Gothic architecture. It is also modified by the introduction of a fillet, and is then called the roll-and-fillet molding.

ROLLER, *Coracias*, a genus of birds very generally referred to the crow family (*corvidæ*), but by many naturalists to the bee-eater family (*meropidæ*), with which they regard the habits and colors of the species as indicating a closer alliance. The bill is moderately large, compressed toward the point, straight, the upper mandible curved downward at the point, the sides bristled at the base, the gape wide; the legs short and strong; the wings long. The colors are in general very brilliant. Mr. Swainson says of the **BLUE-BODIED ROLLER** (*C. cyanogaster*) of western Africa, that "no effort of art can possibly do justice to those inimitably rich lines of ultramarine, beryl color, and changeable fawn, with which it is ornamented; for there are no tints hitherto discovered, either mineral or vegetable, which will enable the painter to produce their successful imitation." The species are pretty numerous, all natives of the old world, and mostly of the warmer parts of it. One only is found in Europe, the **COMMON ROLLER** (*C. garrula*), a bird nearly equal in size to a jay; with head, neck, and wing-coverts greenish-blue, other shades of blue strongly marked in the wings. This bird is abundant in the n. of Africa, and in some parts of Asia; it is partially migratory, and is rare in Britain. It tosses its food, which consists of insects or parts of plants, into the air before eating it, swallowing it when it falls in a proper direction for entering the throat. The name roller is derived from its habit of tumbling in the air like a tumbler-pigeon. It is an inhabitant of woods. It is a very shy bird, and the sportsman always finds it difficult to approach. In the countries where it is abundant, as in some islands of the Mediterranean, it is in high esteem for the table.

ROLLER, an agricultural implement which has been long in use, consisting of a cylinder of wood, stone, or iron, placed in a frame, so as to revolve like a wheel, and drawn over the land by a horse. The weight of the roller is greater or less according to the purpose for which it is intended: the breaking of stiff clay clods, the consolidating of very light soils after frost, the hardening of the surface of the ground to check evaporation, the leveling of an uneven surface before harvest operations, etc. For these and such purposes, the roller is in constant use. The introduction of hollow cylinders of iron, instead of solid ones of wood or stone, is an improvement of no remote date, and was the first change on the old simple implement, which was afterward further modified by dividing the cylinder into two parts, to give greater facility in turning, and to diminish its injurious action in scraping the soil before it while turning; and this process of division being carried further, with other modifications, giving each part or wheel a more independent action, and breaking up the uniformity of surface by giving a raised wedge-like edge to the circumference of each wheel, the result is a *clod-crusher*.

ROLLER, used as part of the mking apparatus in letter-press printing, is of modern invention. In the old process of applying the ink to the surface of types, stuffed leather balls were made use of, which were not only difficult to keep in proper order, but were inapplicable to cylinder-printing. The first improvement on the stuffed balls consisted in covering them with a soft and elastic composition, such as was employed in the Staffordshire potteries. Catching at this idea, the inventors of cylinder printing-machines made rollers by coating longitudinal and rounded pieces of wood with the composition, by means of casting in a mold. This invention came generally into use between 1814 and 1818, everywhere superseding balls, and rendering printing machinery practicable.

The method of making inking-rollers is very simple. A roller may be of any length, to suit work of different kinds; for hand-presses it is usually about 30 in. long, but longer for machines, according to their dimensions. The thickness is about 3 in., of which the composition on the wood is probably three-quarters of an inch all round. The wooden center being fixed upright in an iron mold, the composition is poured in when in a hot liquid state, and then left to cool. When cold, the mold, which is in halves, finely-jointed and held together, is opened, and the roller taken out: by a little trimming it is ready for use. The composition consists of a due proportion of fine glue and treacle or molasses, boiled together, and thoroughly blended—the result being a substance resembling soft india-rubber. The proportions of the two ingredients depend on the state of the atmosphere. In summer, one pound of glue to one pound of treacle may form a suitable mixture; but in winter it may be requisite to give three pounds of treacle to one pound of glue, in order to insure the proper elasticity. Rollers, in time, shrivel and waste by use, and the composition may then be remelted, along with some

small addition of new materials. In all cases, the rollers require to be kept very clean, and suspended in a rack when not in use. The manufacture and supply of rollers for printers constitute a distinct business in London; but elsewhere, as far as we know, every printing establishment of any consequence possesses means of fabricating rollers for itself.

ROLLIN, CHARLES, a French historian, who formerly enjoyed, if he did not merit, an extensive popularity, was the son of a cutler, and was b. in Paris, Jan. 30, 1661. He studied at the college du Plessis, where, in 1683, he became assistant to the professor of rhetoric, and 4 years later obtained the chair for himself. In 1688 he was called to the chair of eloquence at the College Royal de France, and for some 10 years he discharged the duties of his office with remarkable zeal and success. In 1694 he was chosen rector of the university of Paris, a dignity which he held for two years, and signalized his brief tenure of office by many useful reforms, both in regard to discipline and study, and by his warm defense of the privileges of the university. His efforts to revive the study of Greek, then falling back into neglect, were particularly creditable to him, and altogether his career as rector constitutes perhaps his best claim to the regard of posterity, and has certainly left a more permanent impression than his writings, for its influence is perceptible even to the present day. In 1699 he was appointed coadjutor to the principal of the college of Beauvais; but was removed from this situation in 1712, through the machinations of the Jesuits, for Rollin was a strenuous Jansenist. For the next three years he devoted himself exclusively to learned study, the fruit of which was his edition of Quintilian (Paris, 2 vols. 1715). In 1720 he was re-elected rector of the university, and in 1726 published his *Traité des Etudes*, which M. Villemain has pronounced a monument of good sense and taste, and which is justly regarded as his best literary performance, for his *Histoire Ancienne* (Paris, 12 vols. 1730-38), though long prodigiously popular, and translated into several languages (the English among others), is feeble in its philosophy, jejune in its criticism, and often inaccurate in its narrative. Nevertheless, to multitudes, both in this country and in France, it has formed the introduction to the study of ancient history. Frederick the great, then the prince-royal, of Prussia, among other princely notabilities, wrote to compliment the author, and opened up a correspondence with him. In 1738 Rollin published his *Histoire Romaine* (Paris, 9 vols.), a much inferior work, now almost forgotten. He died Sept. 14, 1741.

ROLLIN, LEDRU. See LEDRU-ROLLIN, *ante*.

ROLLING-MILL, one of the most important of modern inventions for the working of metals. It was first introduced practically by Mr. Corb in 1784, and since then has gradually become more and more useful, as its capabilities have been developed. Under the article Iron (q.v.) there is a description of the iron rolling-mill, by means of which bars of iron are rolled or drawn out, and it will be at once seen that the same machine will do for other metals; moreover, the rolls may be engraved so as to impress a pattern on the bar as it passes through; this is done by the brass-workers to a great extent; and tubes of brass, copper, tin, etc., are also operated on in a similar way, a mandrel or rod of iron being fitted inside the tube, to sustain the pressure of the rollers.

ROLLO, or ROLF. See NORMANS, *ante*.

ROLL OF ARMS, a heraldic record of arms, either verbally blazoned or illuminated, or both, on a long strip of vellum, rolled up, instead of being folded into leaves. Rolls of arms are the most important and most authentic materials for the history of early heraldry. In England they go back to the reign of Henry III., the oldest being a copy of a roll of that reign, containing a list of the arms borne by the sovereign, the princes of the blood, and the principal barons and knights between 1216 and 1272, verbally blazoned without drawings. The original has been lost, but the copy, which, having been made by Glover, Somerset herald, in 1586, is called "Glover's Roll," is in the English college of arms. This roll exhibits heraldry as at that early period already consolidated into a system. In the British museum (Harl. Coll., 6,589) is a copy of another roll of the middle of the 13th c., containing 700 coats tricked, that is, drawn in pen and ink. The *Roll of Caerlaverock* is a heraldic poem in Norman-French, reciting the names and arms of the knights present at the siege of Caerlaverock in 1300. It has been published with notes by sir N. H. Nicolas. Copies exist of rolls of the knights who were with Edward I. at the battle of Falkirk.

ROLLS, MASTER OF. See MASTER OF THE ROLLS.

ROLLS OF COURT, in Scotch law, mean the list of causes depending in the court of session.

ROMAGNA. See PAPAL STATES.

ROMAGNO'SI, GIAN DOMENICO, 1761-1835; b. Italy; appointed the superior civil magistrate of Trent. He was accused by the Austrians in 1799 of sympathizing with the French, and was arrested and tried on that charge, but acquitted. While in prison he discovered the deviation of the magnetic needle subjected to a galvanic current. He published an account of his discovery in 1802, but it excited little interest till the discoveries of Oersted some 20 years later. He was professor of law at Parma, Pavia, and Milan; was dismissed from his position at the latter on the downfall of Napoleon, and

was once more acquitted of treason in 1818. His most important work is *Introduzione allo Studio del Diritto Pubblico Universale*, 1805.

ROMAINE, Rev. WILLIAM, an English divine of the last century, noted for the ardor with which he preached "evangelical" and Calvinistic doctrines in an age of religious apathy, was the son of a corn-dealer in Hartlepool, and was b. there, Sept. 25, 1714. His father was a French Protestant refugee. Young Romaine was educated at the grammar-school of Houghton. He was ordained a priest in 1738, and immediately obtained a curacy near Epsom. In 1739 he published a sermon preached before the university of Oxford, in which he attempted to show, in opposition to the view maintained by Warburton in his *Divine Legation of Moses*, that the doctrine of a future state is "expressly mentioned," and even "insisted on," in the Pentateuch. This led to a controversy with Warburton. In 1747 he published the first volume of a new edition of Calasio's *Hebrew Concordance and Lexicon*, the fruit of seven years' labor. The only thing in connection with Romaine's edition that now calls for notice is the fact that he took extraordinary liberties with the original, omitting, for example, the author's account of the word which is usually rendered "God," and substituting his own in the body of the work! In 1748 he was chosen lecturer of St. Botolph's, in London, and, in the following year, lecturer of St. Dunstan-in-the-West. Two years later he was appointed assistant morning-preacher at St. George's; but was afterward deprived of the situation by the rector, Dr. Trebeck, who was jealous of his popularity, and averse to the "plainness" of his preaching. His "evangelicalism" grew with his years; and at length, in 1757, in a sermon on the *Lord Our Righteousness*, it became so offensive to the torpid dons of Oxford that the university pulpit was in future closed against him. Some years before this Romaine had been appointed to the professorship of astronomy in Gresham college, for which he was not fit, and which he did not retain. His intellect was anything but scientific in its character, as will readily be understood when we state that he allowed his "zeal" for Hutchinsonian speculations to lead him into opposition to the Newtonian philosophy. In 1756 he became curate and morning-preacher at St. Olave's, Southwark, a situation which he exchanged in the course of a year for a preachingship at St. Bartholomew the Great, near West Smithfield. In 1766 he was chosen by the parishioners rector of St. Andrew, Wardrobe, and St. Anne, Blackfriars, an office which he held till his death, July 26, 1795. Besides what has been already mentioned, Romaine published *Twelve Sermons upon Solomon's Song* (1759); *Twelve Discourses upon the Law and the Gospel* (1760); *The Life of Faith* (1763); *The Scripture Doctrine of the Sacrament of the Lord's Supper* (1765); *The Walk of Faith* (1771); *An Essay on Psalmody* (1775); *The Triumph of Faith* (1795). His works were republished in a collected form, in 8 vols., in 1796, by the hon. and rev. W. B. Cadogan, who prefaced them with a life of their author.

ROMANA, PEDRO, CARO Y SUREDA, Marquis de la, 1761-1811; b. Majorca, of excellent family; entered the army at an early age. He was at first friendly to the French claims, but in 1808 when he learned that Jerome Bonaparte had been made king of Spain he transferred the forces which he had under his command in the island of Fünen to English ships of war. He had participated in the siege of Gibraltar, and had been placed in command of the army which Napoleon had forced Spain to raise. After Romana's rebellion against the tyranny of Napoleon, he went to London and induced England to assist Spain in her struggle against the French. In the war which followed he was commander-in-chief in the provinces of Biscay, Galicia, and Asturias, and organized the guerrilla warfare. He was eulogized by the duke of Wellington as "the finest ornament of the Spanish army."

ROMAN ALUM. See ROCH ALUM.

ROMAN ARCHITECTURE. Of the early architecture of Rome and the other Latin cities comparatively little is known. With the conquest of Carthage, Greece, and Egypt the Romans became acquainted with the arts of those countries, and began to endeavor to use them for the embellishment of the imperial city. Besides, Rome under the empire was the capital of the world, and attracted artists from every country. The result was that the architecture of Rome became a mixed style. It was all imported, and partook of the character of the importers. The great interest of Roman architecture is, that it is a mixture and amalgamation of all ancient styles, and the starting-point for all modern styles. It is thus the connecting link between ancient and modern art; the whole history of Roman architecture being that of a transition, slow but steady, from the external architecture of the Greeks to the internal architecture of the Christians. Rome borrowed from Greece the oblong peristylar temple, with its horizontal construction and decoration, and the various "orders." See COLUMN, GRECIAN ARCHITECTURE. From the Tuscans, probably, were derived the circular form of temple and the circular arch, which became leading features in the development of the future Roman style.

The orders imported from Greece were the Doric, Ionic, and Corinthian (q.v.). These were all used in Rome, but with some modifications; the Doric, for example, being never used as in Greece, but without fluting, and with the capital and entablature altered, and a base added, so as to make the style more similar to the others, with which it was often associated. The Ionic had the volutes turned out angularwise, so as to present a similar face in each direction. The favorite "order" of the Romans, however,

was the Corinthian. It was invented in Greece, but more fully developed in Rome, where it suited the desire which existed for richness and luxuriance in architecture. Many fine examples of this style exist in Rome (as the pantheon, Jupiter Stator, etc.), and in the provinces (as the maison carrée at Nêmes, Baulbec, etc.), the capitals, wherever found, being designed in endless variety. The composite order was an invention of the Romans, and is sometimes called *the Roman order*. It is a combination of the Ionic and Corinthian. All these orders were used by the Romans, but in a manner peculiar to themselves; they combined with the Greek orders the arch. They placed the columns at wide intervals, and set them on pedestals, to give them and the entablature a proper proportion; while behind the columns they placed square piers, and from them threw arches which supported the wall. This was the favorite Roman style, and may be seen in all their important works (amphitheaters, arches, baths, etc.). They piled one order above another, marking each story with the entablature. As the style proceeded, vaulting and arching became more common, especially in internal construction, but the horizontal ornamentation was never entirely abandoned. Arches of this construction were thrown from pillar to pillar behind the entablature, and gradually the pier was omitted, and the arch openly thrown from pillar to pillar, the architrave bent round it, and the cornice continued horizontally above.

The buildings executed by the Romans are very varied in their character, but the same style was used for temples, baths, amphitheaters, triumphal arches, tombs, etc. The earliest temples of which remains now exist are those of Jupiter Stator in the Forum, Jupiter Tonans, and Mars Ultor, all of the Augustan epoch, and each with only three columns left. These are supposed to have been nearly peripteral, and it is worthy of notice that the cells are all large, and one of them has an *apse*.

One of the most interesting temples of Rome is the pantheon. The portico is of the age of Augustus, but the rotunda is probably considerably later. The dome of the interior is a splendid example of the progress of Roman architecture in developing the use of the arch, and transferring the decoration from the exterior to the interior. The former is in this case totally sacrificed to the latter; but the interior has not yet been surpassed for boldness of construction or simplicity and sublimity of effect. Other examples of circular temples, on a small scale, are found at Tivoli and in Rome, both dedicated to Vesta.

The greatest works of the Romans, however, were not their temples. The basilicas (q.v.), amphitheaters (q.v.), and baths (q.v.) are far more numerous and more stupendous as works of art, and all show how well the Romans had succeeded in producing an internal architecture, which at a later period became so useful as a model for Christian buildings. The basilica of Trajan is a type of the Christian wooden-roofed churches; while that of Maxentius with its great intersecting vaults, its vaulted aisles, and buttresses, contains the germs of the greatest Christian cathedrals. The Roman amphitheaters (q.v.) have never been surpassed for size and grandeur, or for suitability to their purpose. And of the baths (q.v.), sufficient remains still exist, although much decayed, from the perishable nature of the brick and stucco employed in their construction, to prove that the scarcely credible descriptions of contemporaries were surpassed by the magnificence of the buildings themselves.

Among the other varied public works of the Romans are their aqueducts (q.v.) and bridges, triumphal arches (q.v.), pillars of victory, and tombs. Of the tombs of the Romans, the earliest and best specimen is that of Cæcilia Metella (wife of Crassus), on the Appian Way. It consists (like most Roman tombs) of a round drum placed on a square basement, and was probably surmounted by a conical roof. The tomb of Augustus was similar, on a very large scale, and the sloping roof was broken into terraces planted with trees. That of Adrian (now the castle of St. Angelo in Rome) is another enormous example. The tombs were generally ranged along the ways leading to the gates of cities.

The later tombs of Rome are well worthy of study, as they contain many specimens of the transition toward the Christian style. They are generally vaulted, frequently with domes, as, for instance, the tombs of St. Helena and Sta. Costanza. Mr. Fergusson also places the so-called "temple of Minerva Medica" among the tombs. It is a beautifully arranged building with ten sides, all containing deep niches (except the side with the door), surmounted by a clear-story, with ten well-proportioned windows. The vault is polygonal inside and outside; and the pendentives, ribs, buttresses, etc., which played so important a part in the Christian architecture both of the east and west, are distinctly used in its construction.

Of the domestic architecture of the Romans, we have many wonderfully preserved specimens in Herculaneum and Pompeii, showing both the arrangements and decorations of the dwellings of all classes. Of the great palaces and villas, however, none remain except the palace of Diocletian, at Spalatro, in Dalmatia. It is an important building, as it shows many steps in the progress of the style.

ROMAN CATHOLIC CHURCH, the community of Christians throughout the world who recognize the spiritual supremacy of the pope or bishop of Rome, and are united together by the profession of the same faith, and the participation of the same sacraments. The subject will be most conveniently treated by considering under separate

heads the history of this great Christian community; its doctrinal and disciplinary system; and finally, its organization and constitutional forms, especially as affected by the decrees of the late council of the Vatican, and by other doctrinal constitutions of recent years.

Although a few other points of doctrinal difference separate the Roman church from the Greek, Russian, and oriental communions, yet the most palpable ground of division lies in the claim of supremacy in spiritual jurisdiction on the part of the Roman bishop. The history of the Roman church, therefore, in relation to the ancient oriental churches, is, in fact, the history of this claim to supremacy. In the minds of Roman Catholics, the claim of supremacy on the part of the bishop of Rome rests on the belief that Christ conferred on Peter a "primacy of jurisdiction"; that Peter fixed his see and died at Rome (a position which some Protestant historians have called in question altogether); and thus, that the bishops of Rome, as successors of Peter, have succeeded to his prerogatives of supremacy. In this light Catholic historians read the facts of the early history of the church—and they trace to this acknowledgment of the superiority of that see, the numerous references to Rome on matters of doctrine or discipline; the appeals from other churches, even those of Alexandria, Antioch, and Constantinople; the depositions or nominations of bishops, examination and condemnation of heresies, of which the first five centuries, especially the 4th and 5th, present examples, but in which Protestant historians only recognize the natural result of the political and social superiority of Rome as the capital of the Roman empire. The letters of pope Leo the great show beyond question that the bishops of Rome, in the commencement of the 5th c., claimed to speak and act with supreme authority; and the first direct challenge to this claim was made by the patriarch of Constantinople, Acacius, and led to a schism of many years, which, however, terminated in the humiliation of the younger see. In all the controversies upon the incarnation—the Arian, the Nestorian, the Eutyehian, the Monothelite—not only was the orthodoxy of Rome never impeached, but she even supplied at every crisis a rallying point for the orthodox of every church. It was so, again, in the Iconoclast controversy; and although Constantinople, in the time of Gregory the great and again of Nicholas I., renewed the struggle for supremacy, or even equality, the superior position of Rome continued to be recognized. The separation of the Greek church and her dependencies, under the patriarch Michael Cerularius in the year 1054, was but a narrowing of the territorial jurisdiction of Rome; and within that portion of the church which remained faithful, it even enhanced the dignity of Rome, and widened her prerogatives. The abandonment of Italy by the emperors to its fate under the invasion of the barbarians, led to the establishment of the temporal sovereignty of the popes; and the social disorganization of Europe combined with the spiritual authority of the Roman bishop to bring about the general recognition of his authority throughout the kingdoms of Europe as an arbiter in the temporal relations of sovereigns with their subjects, and of sovereigns toward each other. This extraordinary temporal authority was at once the consequence and the support of his acknowledged spiritual power; and even Protestants have recognized the Roman church of the mediæval period as absorbing in itself almost the whole of European Christendom, and as the only public (even though they believe it degenerate and corrupt) representative of the church in the west. The temporary withdrawal of the papal residence from Rome to Avignon brought with it a notable diminution, at least, of the temporal power of the popes, which was still further weakened by the long western schism, by the conflicts of the rival pontiffs, and the scandals which arose therefrom. The modern political institutions which then began to break upon the world so modified the public relations of church and state as by degrees to undo the condition of society in which the temporal power of the popes had its foundation. The great revolution of the 16th c. completed the process.

Nor was the revolution with which the popes thus found themselves face to face without its influence in the external history of the Roman church. The defections consequent on the reformation, and at first numerous and formidable, received a check. The great council of Trent did more to systematize, to define, and to present in popular form the doctrinal belief of Rome than had been accomplished by the united efforts of the schoolmen of the three centuries which preceded the reformation; while the decrees of reformation which it enacted, and still more the schemes of local and individual reform which it originated, and to which it gave the impulse as well as the example, tended to bring about an active internal reform. The latter half of the 16th c. was a period of new life in the Roman church. The celebration of local synods, the establishment of episcopal seminaries, the organization of schools, and other provision for religious instruction—above all, the foundation of active religious orders of both sexes—had the effect of arresting the progress of Protestantism, which in many countries had been at first rapid and decisive; and lord Macaulay has traced out with curious minuteness the line which marks in the several kingdoms the origin and the progress of this religious reaction.

From the end of the 16th c., therefore, the position of the Roman Catholic church, especially in her external relations, may be regarded as settled. The local distribution of the rival churches in the world has hardly been altered, except by migration, since that time. But in her relations to the state, the Roman church has since passed through a long and critical struggle, which is detailed under the heads GALLICAN CHURCH,

FEBRONIANISM, INNOCENT XI. The new theories to which the French revolution gave currency have still further modified these relations; but in most of the European kingdoms they were readjusted after 1815, either by concordat or by some similar mutual agreement. Many conflicting claims on either side, however, still exist; but in the conflict with the state the policy of the Roman Catholic church has generally been to record her protest against any violation of her right, and, this protest having been made, to submit under protest, unless in what are considered the essentials of faith or of discipline. Where the encroachments of the state are considered to violate the essentials of faith or discipline, the resistance must result in definitive separation, as in the case of England under Henry VIII. and his successors, in Poland under the czar, and in Prussia in the now pending conflict.

The details of the doctrinal system of the Roman Catholic church will be best collected and explained from her latest authentic creed, that commonly called "the creed of Pius V.," drawn up as a summary of the authoritative teaching of that ecclesiastical body till the time at which it was written, and published together with certain later doctrinal pronouncements. It is only necessary to premise that, while in the view of Catholics (see **RULE OF FAITH**) all doctrine must be based on the word of God, written or unwritten, the church is the only authoritative judge of that rule of faith. The tribunals which are held to represent this teaching, as well as the subjects to which the privilege extends, and the limits within which it is held to be exercised infallibly, have all been explained under the head **INFALLIBILITY** (q.v.). But Catholics hold that while the church has authority, when doubts or difficulties arise, to propound in such terms as leave no room for doubt new definitions of faith, nevertheless these new definitions must not be regarded as additions to the accepted faith of the church, or indeed to the original deposit of divine teaching, but only as expositions of former articles, or at most as developments of what already existed in the germ, and has but been evolved by controversy, or brought into practical action by the progress of time, and by the change of the external relations of the church. The creed of Pius V. is as follows:

"I, N. N., with a firm faith believe and profess all and every one of those things which are contained in that creed which the holy Roman church maketh use of. To wit: I believe in one God, the Father Almighty, Maker of heaven and earth, of all things visible and invisible, and in one Lord Jesus Christ, the only-begotten Son of God, born of the Father before all ages; God of God; Light of Light; true God of the true God; begotten, not made; consubstantial with the Father, by whom all things were made. Who for us men, and for our salvation, came down from heaven, and was incarnate by the Holy Ghost of the Virgin Mary, and was made man. He was crucified also for us under Pontius Pilate, suffered, and was buried. And the third day he rose again according to the Scriptures: he ascended into heaven, sitteth at the right hand of the Father, and shall come again with glory to judge the living and the dead; of whose kingdom there shall be no end. I believe in the Holy Ghost, the Lord and life-giver, who proceedeth from the Father and the Son; who, together with the Father and the Son, is adored and glorified; who spake by the prophets. And in one holy, Catholic, and apostolic church. I confess one baptism for the remission of sins; and I look for the resurrection of the dead, and the life of the world to come. Amen.

"I most steadfastly admit and embrace the apostolical and ecclesiastical traditions, and all other observances and constitutions of the same church.

"I also admit the holy Scriptures, according to that sense which our holy mother the church hath held and doth hold; to whom it belongeth to judge of the true sense and interpretation of the Scriptures; neither will I ever take and interpret them otherwise than according to the unanimous consent of the fathers.

"I also profess that there are truly and properly seven sacraments of the new law, instituted by Jesus Christ, our Lord, and necessary for the salvation of mankind, though not all for every one: to wit—baptism, confirmation, the eucharist, penance, extreme unction, order, and matrimony; and that they confer grace; and that of these baptism, confirmation, and order cannot be repeated without sacrilege. I also receive and admit the received and approved ceremonies of the Catholic church, used in the solemn administration of the aforesaid sacraments.

"I embrace and receive all and every one of the things which have been defined and declared in the holy council of Trent concerning original sin and justification.

"I profess, likewise, that in the mass there is offered to God a true, proper, and propitiatory sacrifice for the living and the dead; and that in the most holy sacrament of the eucharist there is truly, really, and substantially the body and blood, together with the soul and divinity of our Lord Jesus Christ; and that there is made a conversion of the whole substance of the bread into the body, and of the whole substance of the wine into the blood; which conversion the Catholic church calleth transubstantiation. I also confess that under either kind alone Christ is received whole and entire, and a true sacrament.

"I constantly hold that there is a purgatory, and that the souls therein detained are helped by the suffrages of the faithful.

"Likewise, that the saints reigning together with Christ are to be honored and invoked, and that they offer prayers to God for us, and that their relics are to be had in veneration.

"I most firmly assert that the images of Christ, of the mother of God, ever virgin, and also of other saints, ought to be had and retained, and that due honor and veneration are to be given them.

"I also affirm that the power of indulgences was left by Christ in the church, and that the use of them is most wholesome to Christian people.

"I acknowledge the holy Catholic, apostolic, Roman church for the mother and mistress of all churches; and I promise true obedience to the bishop of Rome, successor of St. Peter, prince of the apostles, and vicar of Jesus Christ.

"I likewise undoubtedly receive and profess all other things delivered, defined, and declared, particularly by the holy council of Trent; and I condemn, reject, and anathematize all things contrary thereto, and all heresies which the church hath condemned, rejected, and anathematized.

"I, N. N., do at this present freely profess, and sincerely hold this true Catholic faith, out of which no one can be saved; and I promise most constantly to retain and confess the same entire and inviolate, by God's assistance, to the end of my life."

In addition to these articles, the Roman Catholic church has, since the compilation of the creed of Pius V., defined certain further doctrines in the controversy on grace, which arose from the teaching of Jansenius (q. v.): still more recently that of the immaculate conception of the blessed Virgin Mary (q. v.); and a still more comprehensive body of articles in the memorable *Syllabus* issued by pope Pius IX., and in the decrees of the Vatican council, celebrated under the presidency of the same pontiff. The doctrinal decisions of this latter council are divided into two sections, the first, "on the Catholic faith," the second "on the church of Christ." Each section contains a "scheme of doctrine," in which the heads of belief, and the grounds on which they rest, are explained; and to each is appended a body of "canons," in which the several points are summarized, stated in precise theological language, and defined as articles of Catholic belief. In the scheme "upon the church of Christ" are contained, in "an additional chapter," the celebrated declarations regarding the infallibility of the pope. See *Omnium Conciliorum Vaticanorum Documentorum Collectio* (Svo, Paderborniæ, 1873).

The details of the discipline of the Roman Catholic church would be out of place here. But it may be observed that the Roman Catholic church leans toward asceticism, as regards the practice of fasting, with less rigor than the Greek and oriental communions; while, on the contrary, as to the celibacy of the clergy (q. v.), her law is much more stringent; all the clergy of the Roman Catholic church in the greater orders, including sub-deacons, being so strictly bound to celibacy that a marriage contracted after ordination is invalid by the church law. See **ORDERS**. In all that regards the general discipline of the whole church, only the pope or a general council is considered to have power to legislate; national or provincial synods for the discipline of a kingdom or province, and bishops for that of their own dioceses.

The constitution of the Roman Catholic church has been in great part explained in the article **HIERARCHY**. It may be necessary to add that, under the generic name Roman Catholics are comprised all those Christians who acknowledge the supremacy of the Roman pontiff, even though they be not of the Roman or Latin rite (q. v.). Not a few individuals and churches of other rites are included under this designation, Greeks, Slavonians, Ruthenians, Syrians (including Maronites), Copts, and Armenians; and these communities are permitted to retain their own national liturgy and language, and for the most part their established discipline and usages. The most remarkable examples of the diversity of discipline thus introduced under the common rule of the Roman pontiff are the retention in the east of the use of the cup for the laity, and the permission of the marriage of the clergy.

As regards its organization for the purposes of ecclesiastical government, the normal territorial distribution of the Roman Catholic church of the several rites in the various countries where it exists is into provinces, which are subject to archbishops, and are subdivided into bishoprics, each governed by its own bishop. The total number of archbishops of the several rites in communion with Rome in 1875 was 177, or whom 12 bore the title of patriarch. The number of bishops was 712. But in certain parts of the world, where the population and government are Protestant or unbelieving, the spiritual affairs of the Catholic church are directed, not by bishops with local titles, but by bishops *in partibus infidelium* (q. v.), who are styled vicars of the pope, or vicars-apostolic. The full number of archbishops and bishops in 1875, including those *retired* and those with sees *in partibus infidelium*, was 1103.

The statistics of the Roman Catholic church, as contained in the *Orbe Cattolico*, published at Rome, give us the total number of Catholics of all nations as 185,000,000. This number nearly corresponds with the total of Roman Catholics as given in the article on religion (q. v.). In order to avoid unnecessary repetition, we refer to that article for the details of the distribution of Roman Catholics in the several countries; and for the number of those subjects of the pope who follow a rite different from that of Rome, see **GREEK CHURCH**, **RUSSIAN CHURCH**, **SYRIA**, **MARONITES**.

ROMAN CATHOLIC CHURCH (*ante*) in the United States has a complete organization extending over the whole country, which it divides, ecclesiastically, into 12 provinces, containing 61 dioceses, and 9 vicariates-apostolic; in subjection to the spirit-

ual government of the pope, administered through 1 cardinal, 13 archbishops, 62 bishops, and 6,494 priests. It has 8,158 churches, chapels, and stations where religious services are held; a very large number of "institutions" established for religious, literary, benevolent, and other ecclesiastical purposes; and a system of parochial schools attended probably by 500,000 children. Its own estimates of "Catholic population" throughout the country make an aggregate of 6,225,000.

ROMAN CATHOLIC EMANCIPATION OR RELIEF ACTS. After the reformation, both in England and in Scotland, Roman Catholics were subjected to many penal regulations and restrictions. As late as 1780 the law of England—which, however, was not always rigidly enforced—made it felony in a foreign Roman Catholic priest, and high treason in one who was a native of the kingdom to teach the doctrines or perform divine service according to the rites of his church. Roman Catholics were debarred from acquiring land by purchase. Persons educated abroad in the Roman Catholic faith were declared incapable of succeeding to real property, and their estates were forfeited to the next Protestant heir. A son or other nearest relation, being a Protestant, was empowered to take possession of the estate of his Roman Catholic father or other kinsman during his life. A Roman Catholic was disqualified from undertaking the guardianship even of Roman Catholic children. Roman Catholics were excluded from the legal profession, and it was presumed that a Protestant lawyer who married a Roman Catholic had adopted the faith of his wife. It was a capital offense for a Roman Catholic priest to celebrate a marriage between a Protestant and Roman Catholic. Such was the state of the law, not only in England but in Ireland, where the large majority of the population adhered to the old faith. In Scotland, also, Roman Catholics were prohibited from purchasing or taking by succession landed property. The inexpediency and irrationality of imposing fetters of this description on persons not suspected of disloyalty, and from whom danger was no longer apprehended, began about 1778 to occupy the attention of liberal-minded statesmen; and in 1780 sir George Saville introduced a bill for the repeal of some of the most severe disqualifications in the case of such Roman Catholics as would submit to a proposed test. This test included an oath of allegiance to the sovereign, and abjuration of the pretender, a declaration of disbelief in the several doctrines, that it is lawful to put individuals to death on pretense of their being heretics; that no faith is to be kept with heretics; that princes excommunicated may be deposed or put to death; and that the pope is entitled to any temporal jurisdiction within the realm. The bill, from the operation of which Scotland was exempted, eventually passed into law. An attempt which had been made at the same time to obtain a like measure of relief for the Roman Catholics of Scotland was defeated by an outburst of religious fanaticism. The populace of Edinburgh, stirred up by a body called "the committee for the Protestant interest," attacked and set fire to the Roman Catholic churches, and the houses of the clergy and of such persons as were suspected to be favorable to Roman Catholic relief. The frenzy spread to England, where a "Protestant association" had been formed to oppose the resolutions of the legislature. See GORDON, LORD GEORGE. In 1791 a bill was passed affording further relief to such Roman Catholics as would sign a protest against the temporal power of the pope, and his authority to release from civil obligations; and in the following year, by the statute 33 Geo. III. c. 44, the most highly penal of the restrictions bearing on the Scottish Roman Catholics were removed without opposition, a form of oath and declaration being prescribed, on taking which they could freely purchase or inherit landed property.

Endeavors were made at the same time by the Irish parliament to get rid of the more important disqualifications, and place Ireland on an equality in point of religious freedom with England. In 1780 Grattan carried his resolution that the king and parliament of Ireland could alone make laws that would bind the Irish, and separation from England was urged as the alternative with repeal of the disqualifying statutes. The agitation culminated in the Irish rebellion of 1798; the union of 1800 followed, which was partly carried by means of pledges, not redeemed, regarding the removal of the disabilities in question. Meantime, in England, Roman Catholics continued subject to many minor disabilities, which the above-mentioned acts failed to remove. They were excluded from sitting and voting in parliament, and from enjoying numerous offices, franchises, and civil rights, by the requirement of signing the declaration against transubstantiation, the invocation of saints, and the sacrifice of the mass. In the early part of this century many measures were proposed for the removal of these disqualifications, and in 1813 and succeeding years, one bill after another for this end was thrown out. Meanwhile, the agitation on the subject among the Roman Catholics themselves greatly increased, and in 1824 it assumed an organized shape by the formation of the "Roman Catholic association" in Ireland, with its systematic collections for the "Catholic rent." The duke of Wellington, who, for a long time, felt great repugnance to admit the Roman Catholic claims, was at last brought to the conviction that the security of the empire would be imperiled by further resisting them, and in 1829 a measure was introduced by the duke's ministry for Catholic emancipation. An act having been first passed for the suppression of the Roman Catholic association—which had already voted its own dissolution—the celebrated Roman Catholic relief bill was introduced by Mr. Peel in the house of commons on Mar. 5, and after passing both houses, received the royal assent April 13. By this act (10 Geo. IV. c. 7),

an oath is substituted for the oaths of allegiance, supremacy, and abjuration, on taking which Roman Catholics may sit or vote in either house of parliament, and be admitted to most other offices from which they were before excluded. They, however, continue to be excluded from the offices of guardian and justice or regent of the United Kingdom, lord chancellor, lord keeper, or lord commissioner of the great seal of Great Britain or Ireland, and lord high commissioner to the general assembly of the church of Scotland. As members of corporations, they cannot vote in the disposal of church property or patronage. Ecclesiastics or other members of the Roman Catholic persuasion, either wearing the habit of their order, or officiating in any place which is not their usual place of worship, or a private house, forfeit £50. Jesuits, and members of orders bound by monastic or religious vows, must register themselves with the clerk of the peace of their county, under a penalty of £50 for every month that they remain in the kingdom unregistered. Jesuits not natural-born subjects, who have come into the country since the passing of the act, are liable to be banished. Persons admitting others to such societies within the United Kingdom are liable to fine and imprisonment, and those who have been so admitted are liable to be banished.

Restrictions which existed on Roman Catholic bequests were removed by 2 and 3 Will. IV. c. 115, as regards Great Britain, and by 7 and 8 Vict. c. 60, with relation to Ireland. Acts 7 and 8 Vict. c. 102, and 9 and 10 Vict. c. 59, abolished a few minor Roman Catholic disabilities. For the statutory prohibition against the assumption of ecclesiastical titles in respect of places in the United Kingdom, see ECCLESIASTICAL TITLES. ASSUMPTION ACT.

ROMAN CEMENT. See CEMENTS.

ROMANESQUE ARCHITECTURE, the debased style which succeeded Roman architecture, from about the time of Constantine (350 A.D.) to that of Charlemagne (800 A.D.). It is impossible to fix the date of the style definitely, because Roman architecture (q.v.) was itself a transitional style, and the one fades gradually into the other. When Constantine proclaimed Christianity the religion of the empire, he gave the Christians freedom of action. They could worship in public, and consequently desired buildings for their service; hence the impetus which gave architecture a new start. As explained under APSE and BASILICA, the Christians adopted the Roman hall of justice for their church or place of assembly, and erected many noble basilicas in Rome, Ravenna, and all over the empire. These consisted of three or five aisled halls—the aisles separated by rows of columns. In Rome the columns, entablatures, and other ornaments were frequently taken from the ruins of ancient buildings which abounded there. The new style is therefore closely allied to the ancient one in the imperial city; but in Ravenna, Jerusalem, Provence, and the remoter districts, where few ancient remains exist, a simpler and ruder copy of the ancient work is found. There is always, however, a certain resemblance to the old forms which distinguishes the Romanesque from the round-arched Gothic which succeeded it. The piers along the isles are always single columns, generally with caps intended to be Corinthian, and wide arches: the aisles are wide, with open wooden roof; and there are remnants of entablatures, moldings, etc., which recall the ancient Roman work. The early Christians also derived their round churches from the Romans. They were probably originally tombs, copied from such buildings as the *Minerva Medica* (see ROMAN ARCHITECTURE), and were the most sacred places where the burial-service was said and the sacraments administered. Hence they afterward became baptisteries (q.v.), and were finally absorbed into the church (see RHENISH ARCHITECTURE), which then contained within itself everything connected with the Christian service.

In Rome there are still some thirty basilicas, and the Romanesque style may be said never to have died out there. As we recede from the center, we find its influence gradually weaken and succumb to the northern Gothic style. Thus in Lombardy and Provence it was superseded by the Lombard (q.v.) and Romance styles in the 11th and 12th centuries, while in Byzantium and the east it gave way to the Byzantine style about the time of Justinian. Among the finest examples remaining are St. Paul's (see BASILICA) and Sta Maria Maggiore at Rome, and at Ravenna St. Apollinare, the interior decoration of which last is very beautiful. The mosaics of the apse, the painted walls, and the inlaid pavements of the Romanesque churches are among their finest features. In color they always excel.

In Tuscany there is a late form of Romanesque, of which the cathedrals at Pisa and Lucca, San Miniato at Florence, and many churches in those cities are examples. They are intermediate specimens, built during the 11th c., when the cities became prosperous, and have a certain amount of Gothic feeling; but although beautiful in colored decoration, they have not the simple grandeur of the early basilicas; and although more decorated externally than these, they have not the bold and purpose-like appearance of Gothic elevations.

ROMANIA, or RUMANIA (often written ROUMANIA). See the article MOLDAVIA AND WALLACHIA, to which this short notice serves as a continuation and conclusion. A military revolt took place in Feb., 1866, which resulted in the deposition of prince Couza—Alexander John I. The count of Flanders, younger brother of Leopold II. of Belgium, was unanimously chosen hospodar; but he at once declined the perilous honor. Upon this the choice of the Romanians fell upon prince Charles of Hohenzollern-Sigmaringen,

who was proclaimed prince of Romania on April 20, 1866. The existing constitution was then adopted. When war broke out between Russia and Turkey in April, 1877, Romania signed a convention with Russia, guaranteeing the Russian troops a free passage through Romanian territory; and on May 21 the chamber of deputies at Bucharest decreed the independence of Romania. War was declared with Turkey, and the Romanian army bore a creditable part in several battles, especially before Plevna. The Berlin congress of 1878, which revised the treaty of San Stefano concluded between Russia and Turkey, and has attempted the most recent solution of the "eastern question," agreed to recognize the independence of Romania. It resolved, however, much against the will of the government and people of Romania, to restore to Russia the portions of Bessarabia (q.v.) touching the Pruth and Danube, which were given by the treaty of Paris to Moldavia in 1856; and, by a rough sort of compensation, Romania received the Dobrukscha (q.v.), bounded on the s. by a line from Silistria to Mangalia. It was stipulated that difference of religious profession should not disqualify from the exercise of full civil and political rights in Romania.

ROMANIC LANGUAGES, a general name for those modern languages that are the immediate descendants of the language of ancient Rome. In those parts of the empire in which the Roman dominion and civil institutions had been most completely established, the native languages were speedily and completely supplanted by that of the conquerors—the Latin. This was the case in Italy itself, in the Spanish peninsula, in Gaul or France, including parts of Switzerland, and in Dacia (see under **MOLDAVIA**). When the Roman empire was broken up by the irruptions of the northern nations (in the 5th and 6th centuries), the intruding tribes stood to the Romanized inhabitants in the relation of a ruling caste to a subject population. The dominant Germans continued for several centuries to use their native tongue among themselves; but from the first they seem to have acknowledged the supremacy of the Latin for civil and ecclesiastical purposes, and at last the language of the rulers was merged in that of their subjects, not, however, without leaving decided traces of the struggle—traces chiefly visible in the intrusion of numerous German words, and in the mutilation of the grammatical forms or inflections of the ancient Latin, and the substitution thereof of prepositions and auxiliary verbs. It is also to be borne in mind that the language which underwent this change was not the classical Latin of literature, but a popular Roman language (*lingua Romana rustica*) which had been used by the side of the classical, and differed from it—not to the extent of being radically and grammatically another tongue, as some writers unwarrantably conclude—but chiefly by slovenly pronunciation, the neglect or misuse of grammatical forms, and the use of "low" and unusual words and idioms. As distinguished from the old *lingua Latina*, the language of the church, the school, and the law, this newly-formed language of ordinary intercourse in its various dialects was known as the *lingua Romana*; and from this name, probably through the adverb *romanicé*, came the term *romance* (Prov. and O. Fr. *romans*, Sp. *romance*, It. *romanzo*), applied both to the language and to the popular poetry written in it, more especially to the dialect and productions of the troubadours in the south of France.

According to the theory of Raynouard (q.v.), the new language that sprang out of the corruption of the Latin was at first essentially the same over all the countries in which Latin had been spoken, and is preserved to us in a pure state in the Provençal or language of the troubadours; and it was from this as a common ground, and not from the original Latin, that the several Neo-Latin tongues diverged into the different forms which they now present. This theory is not accepted by more recent inquirers; its groundlessness has been demonstrated by sir G. Cornewall Lewis in his elaborate *Essay on the Origin and Formation of the Romance Languages* (2d ed. Lond. 1862). It is beyond doubt that the several daughters of the mother Latin had their characteristic differences from the very first, as, indeed, was inevitable. The original Latin spoken in the several provinces of the Roman empire must have had very different degrees of purity, and the corruptions in one region must have differed from those in another according to the nature of the superseded tongues. To these differences in the fundamental Latin must be added those of the superadded German element, consisting chiefly in the variety of dialects spoken by the invading nations and the different proportions of the conquering population to the conquered. French, e.g., as was to be expected, is richer in German words than any other member of the family, having 450 not found in the others. Italian is next to French in this respect. There are about 900 in the Romanic languages altogether, of which about 300 are common to them all. A great many of these words are terms relating to warfare.

The varieties of speech originating in the way now described (which first received the general name of Romanic* languages in recent times from German scholars—*Romanische Sprachen*) are divided by Diez into six jurisdictions:

1. The Italian, preserving, as was to be expected, the traits of the mother Latin in more recognizable form than any of the sister tongues. It presents a variety of strongly marked dialects.

* *Romanic* seems preferable to *romance*, the term employed by many English writers, both as being more in analogy with *Italic*, *Arabic*, etc., and as avoiding the association with a particular kind of literature, and the special Neo-Latin tongue in which that literature was originally written, viz., the Provençal.

2. The Wallachian (see under MOLDAVIA).

3. The Spanish, which is characterized by copiousness and etymological obscurity, arising from the establishment of so many different nations on the soil. For one element of difference it contains a large number of Arabic words—as many as 500 terms have been enumerated. Of the various dialects the Castilian is considered the standard.

4. The Portuguese, including both the language of Portugal and of Galicia; it is nearly akin to the Spanish, but differs too much in some points of grammar to be reckoned a mere dialect.

5. Provençal, the language of the south of France, extending on the one side into Spain over Catalonia, Valencia, and the Balearic isles; and on the other over Savoy and part of Switzerland, about the lake of Geneva. The line of division between the Provençal and the northern idiom which has now become the literary language of the whole of France, is usually drawn through Dauphiné, Lyonnais, Auvergne, Limousin, Perigord, and Saintonge. From the use of the affirmative *oc* (= yes), the Provençal was known as the Langue d'oc, as the northern French was called the Langue d'oïl, from *oïl*, modern French *oui* (see LANGUEDOC).* The Provençal was at an early period a cultivated language, with a regular system of grammar, and in the 12th and 13th centuries produced a rich poetical literature (see TROUBADOURS).

6. French, extending over the northern half of France, and parts of Belgium and Switzerland. Diez conceives that at first northern French may have been little different from Provençal, but beginning with the 9th c. it has been more and more distinguished by the greater wearing away of the original grammatical forms. See FRENCH LANGUAGE AND LITERATURE.

The language of the canton of the Grisons (q.v.), anciently *Rhetia*, though sufficiently distinct from Italian and French, is not considered by Diez to have attained sufficient fixity or independence to deserve being ranked along with the others as a seventh Romanic tongue. It is called by the Germans *Cur-wälsch*, by the people themselves *Rumonsh*. There are two chief dialects, the Oberland, about the sources of the Rhine, and that spoken in the Engadine (q.v.), called the Ladin.

The chief authorities on this subject are the two great works of Diez (q.v.), the grammar and the dictionary of the Romanic languages. The dictionary and the introduction to the grammar have been translated into English.

ROMAN LAW. See LAW, CIVIL.

ROMANOFF, HOUSE OF, of which the present imperial family of Russia is the chief representative, is said to have derived its origin from a Lithuanian prince of the 4th c.; but however this may be, it is certain that the family did not make its appearance in Russia till the 14th c., when Andrew Kobyla emigrated from Prussia to Moscow in 1341 and entered the service of the then grand-duke, Simeon the fierce. Andrew's descendants became bojars early in the 15th c., their territories lying in the government of Vladimir and district of Jurief-Polskoi. The bojar *Roman Jurievitch*, the fifth in direct descent from Andrew, died in 1543, leaving a son and daughter, the latter of whom became czarina by her marriage with Ivan the terrible; while the former, *Nikita Romanovitch Jurief*, by his nuptials with the princess of Susdal (a direct descendant from a brother of St. Alexander Nevskoi), was also allied to the royal race of Rurik. Nikita was one of the regency during the minority of Feodor I.; and his eldest son Feodor, under the name of *Philarete*, was elevated to the rank of archimandrite and metropolitan of Rostof during the reign of the false Dmitri. The Romanoffs supported that party who tendered the Russian crown to the Polish prince, and Philarete had gone with that view to Poland, when a sudden outburst of national sentiment put a stop to these negotiations, and the unlucky envoy was in consequence thrown into prison by the enraged Poles. The national party now proceeded to the election of a native sovereign, who should be as closely allied as possible by blood to the race of Rurik; and after much hesitation and many rejections they chose MIKAIL FEODOROVITCH ROMANOFF, the son of the imprisoned metropolitan, and the representative, through his grandmother, of the royal house of Rurik, Feb. 21, 1613. This selection, which had been made by the higher nobility and the clergy, was rapturously applauded by the people; and though the new czar was not quite seventeen years of age, the general desire of all classes to conform to his ordinances rendered the cares of government comparatively light. He was succeeded by his eldest son, *Alexei Mikailovitch* (1648-76), an able prince, who carried on war with varied success against the Swedes and Poles, and acquired a great reputation as a legislator. Alexei was twice married, and left by his first wife two sons, Feodor and Ivan, and many daughters, and by his second wife one son, Peter. His eldest son Feodor (1676-82), was a prince of much talent and foresight, and labored with success to reduce the power of the aristocracy; but being of a very weak constitution he died at the age of twenty-five without posterity, leaving the throne by his will to his half-brother, Peter, as his full brother, Ivan, was an imbecile. However, it was not till seven years after this that *Peter* (see PETER THE GREAT) succeeded in obtaining possession of the throne.

* Instead of the etymologies of *oc* and *oïl* given in the article referred to, Diez derives *oc* from Lat. *hoc*, this (equivalent to Eng. *so*, Ital. and Fr. *si*, which are only other forms of the pronoun [q.v.] *so* or *ta*); in the north *oc* was first shortened into *o*, and then compounded with *il* (Lat. *hoc illud*).

It is worthy of remark that hitherto all the czars of the house of Romanoff had mounted the throne before attaining twenty years of age. Peter (see PETER THE GREAT) was twice married; by his first marriage he had a son, Alexis (q. v.), who died during his father's lifetime, leaving one son, Peter, afterward Peter II.; and by his second marriage with *Catharine I.* (q. v.) (1725-27) he had two daughters, Anne and Elizabeth. Catharine I. left the throne to her step-grandson, *Peter II.* (1727-30), the last of the male line of Romanoffs; and on his death without heirs the succession reverted to the female line. Ivan, Peter the great's half-brother, had also left daughters, and their claims to the crown being preferable, one of them, *Anna Ivanovna* (1730-40), was placed upon the throne, and was succeeded by her grand-nephew, *Ivan I.* (1740-41); but then a revolution drove Ivan's family from the throne, of which the cadet female line in the person of *Elizabeth* (1741-61), the daughter of Peter the great and Catharine, obtained possession. Failing heirs of Elizabeth, her nephew Peter, the son of her elder sister Anna Petrovna, who had married the duke of Holstein-Gottorp (a cadet of the family of Oldenburg), and died in 1728, was the heir-presumptive; and accordingly, on her death in 1761, he mounted the throne as *Peter III.* (1761-62), founding a new dynasty, that of ROMANOFF-OLDENBURG; but his brief tenure of power was put an end to by his assassination at the instigation of his wife, the princess Sophia-Augusta of Anhalt-Zerbst, who as Catharine II. (1762-96) wielded the scepter of this mighty empire for the long period of thirty-four years. She was succeeded by *Paul I.* (q. v.) (1796-1801), her only son by Peter III.; and Paul after a brief reign was also assassinated, leaving several sons, the eldest of whom was *Alexander I.* (1801-25); but as he left no issue, the crown at his death devolved by right upon his next brother, Constantine. Constantine had, however, in compliance with the wish of his elder brother, previously relinquished his claims to the supreme power, and the third brother, *Nicholas I.* (1825-55) in consequence ascended the throne. Nicholas left at his death four sons and several daughters, and his eldest son, *Alexander II.* (1855) is the present czar.

ROMAN RELIGION, ANCIENT, a conglomeration of the most widely-different theological or rather mythological elements, introduced by the various strata of immigrations that flowed into the different parts of Italy at different prehistoric times. It was chiefly under Greek influence that it assumed that most characteristic and systematic form, under which it was known during the classical times of Rome, and as which it generally represents itself to our minds. Numa Pompilius (q. v.) that mythic successor of Romulus, is by the primitive legend mentioned as the founder of the Roman religion, or rather ceremonial law. He is probably the type of the period when the religious notions of the Sabines were first joined to the primitive elements of legendary belief of the early settlers. Among the vast number of the different and obscure component elements, the Pelasgian, Sabellian, Oscan, Gallic, etc., out of which grew the recognized state religion, we can, with a comparative amount of clearness, distinguish chiefly three—the Etruscan, the Sabine, and the Latin. The religion of the Etruscans—as distinct from the Pelasgians (q. v.)—has been characterized in our article on that nation. Of the gods of the Latins, many are closely related to those of the Greeks (see GREEK RELIGION), a circumstance easily accounted for by their common eastern origin (see ROME, HISTORY OF); others, however, seem indigenous. Their principal deities are Tellus (q. v.) (the earth), Saturn (q. v.) (god of seeds), and his wife Ops (goddess of earth and plenty), who are somewhat akin to Kronos and Rhea; Jupiter (q. v.), with Juno (q. v.), givers of light. Deities more peculiar to the Latins are Janus (q. v.), and Diana (q. v.). Faunus and Fauna are prophesying wood-deities, and were allied to Lupercus, in whose honor the Lupercalia (q. v.) were celebrated; Picus and Pilumnus, who preside in some way over agriculture and the fruits of the field; Vesta (q. v.); Fortuna (q. v.); Ferentina, the goddess of leagues. A certain number of agrarian deities (Anna Perenna, Venus, etc.) make up, with those mentioned, the bulk of "native" Latin numina. Of chiefly Sabine deities, we name Feronia, the Ferentina of the Latins, a goddess of the soil, who was worshipped with gifts of flowers and fruits; and the two war-gods, Mars and Quirinus—the former a deity at first worshipped under the symbol of shield and spear, and of high importance for colonizations, to whom every animal and every human being born in a certain year was sacred: the former being doomed to be sacrificed, and the latter at the age of twenty to emigrate, and to found new settlements; Quirinus, a deity of strife, closely connected with the myth of Romulus. Sabine deities were also Sol, the sun, Luna, the moon, etc.

Having thus traced some of the principal gods and goddesses (of the greater part of whom fuller information will be found in special articles in the course of this work) to the respective nationality that first introduced them into Italy, we shall now take a brief glance at the Roman pantheon as it appeared when it had embodied systematically these acclimatized primeval idealizations. For it was as characteristic of the Roman gods to appear in sets, as it was for the more personal gods of the Hellenes to appear singly. The Romans, as it were, made them fall rationally into rank and file, each with a distinct mission of its own, and thus filled with them, as with authorities over special departments, the whole visible and invisible world—above, below, and around. The first rank of all is taken by the three Capitoline deities, the personifications of highest power, highest womanliness, and highest wisdom—Jupiter (q. v.), Juno (q. v.), the queen of

heaven, and the tutelary deity of women; and Minerva (q. v.). The stars also had three foremost representatives—Sol, the sun, Luna, the moon, and Tellus, the earth. The supreme deities of the infernal regions were Orcus, Dis (Dives, Consus?), and his wife, the queen of the empire of the shadows, Libitina. The element of the water was presided over by Neptune (q. v.); that of the fire by Vulcan (q. v.), the god of the smithies, and Vesta, the goddess of the domestic hearth and its pure flame. Agriculture and rearing cattle were sacred to the ancient Latin king Saturnus, whose wife, Ops—the riches therefrom accruing—had, like Demeter, her seat in the soil. Ceres, Liber, and Libera, the three Greek deities of agricultural pursuits, were superadded about 500 B.C. Pales, the special protector of the flocks, and his festival (the Palilia) were celebrated on the foundation-day of Rome. Mars himself was the supreme deity of the Romans next to Jupiter. Deities of oracles are Faunus, a deified king, who gave his obscure decisions either in dreams or in strange voices, and his female relative—wife, daughter, or sister—Fauna (Bona Dea), who attends only to the female sex; and the Cameræ, prophesying nymphs, of whose number was Egeria, Numa Pompilius's inspirer. The Apollo worship was but of late growth in Rome. The Parcæ represented the unchangeable fate of the individual. Fortuna was, on the contrary, the uncertain chance of destiny, the "luck" to be invoked at all important junctures. Salus, Pax, Concordia, Libertas, Felicitas, Pietas, Virtus, Honos, Spes, and a host of other abstract notions, explain themselves. Venus first became important when identified with Aphrodite; in the same way as Amor, Cupido, and Voluptas were Greek importations, brought into prominence by the poets chiefly. Life, death, and life after death are made concrete, by the Genii, the Lares, Manes, and Penates. See LARES.

Like the Greeks, the early Romans had no "mediators," but addressed their prayers and supplications directly to the individual god. The priesthood, we find, in the classical period, had arisen originally from the "kindlers (*flamines*) of Mars," or those who presented burnt offerings to the early Italian war-god Mars, and the twelve dancers (*salii*), who in March performed war-dances in his honor. To these came the "Field Brethren," the "Wolf-repellers," etc.; and thus by degrees an endless and most powerful hierarchy came to be built up. By the side of it, but not identical with it, were certain sacred colleges, who kept the sacred traditions alive, and who were the supreme authority on religious observances. These were the colleges of Pontifices (q. v.) or Bridge-builders, of Augurs (see AUGURIES and AUSPICES), the keepers of the Sibylline books (see SIBYL); the twenty Fetiales or state heralds, the supreme—advising, not executing—authorities on international law; the Vestal virgins, on whom devolved the guardianship of the Palladium and of the sacred fire; the Salii (see above), and others. Priests, in the stricter sense of the word, in the service of special deities, were the Flamens (q. v.); while the Dea Dia, the goddess of fields (Tellus, Ceres, Ops, Flora), had the special brotherhood of the twelve Arvalian brothers, with their numerous followers. The state sacrifice, before the expulsion of the mythical kings supposed to have been offered up by these, was offered by a special *rex sacrorum* or *rex sacrificum*.

The mode of worship was analogous to that of the Greeks. Votive offerings, prayers, vows, sacrifices, libations, purifications, banquets, lays, songs, dances, and games made up the sum of their divine service. The sacred places were either *fana*, *delubra*—mere hallowed spots on hills and in groves—or *templa*, *ades*, special buildings dedicated to a special deity. The latter contained two altars—the *ara*, for libations and oblations; and the *altare*, for burnt offerings chiefly. Frugality, as it pervaded, in the classical period, the domestic life, so it also prevented all extravagance of offerings to the deity, and all excess of rejoicing before it. Sober and dull, as the Roman religion undoubtedly was—for it never once expanded into the joyful extravagances of fancy with which the Greek religion was fraught throughout—it at the same time kept free from the abominations that are the natural offspring of that unbounded sway of fancy. Human sacrifices, as far as they are to be met with, grew out of the idea of substitution, and were chiefly enthusiastic voluntary acts of men who threw themselves into the breach; or they carried out decrees of civil tribunals, who had convicted the "victim" of a deadly offense. In their dealings with the gods, the Romans were pure merchants, carrying out their promises with strict literalness, and thus often fraudulently, against the patent inner meaning of their promise; but the gods were not to them the all-pervading essences, but rather creditors, strict and powerful, yet unable to exact more than was agreed upon outwardly.

A code of moral and ethical rules, furthering and preserving civil order, and the pious relations within the state and family, were the palpable results of this religion, which, in its barrenness of metaphysical notions, did next to nothing for the furtherance of art.

And here we must enter somewhat more fully into that peculiar phenomenon of the utter dissimilarity in the characters of the Greek and Roman religion, at which we have hinted already—a dissimilarity all the more surprising, as the self-same symbolical and allegorical views of nature, filtered through however different channels, form the foundation of both. Both also—especially in their later stages—offer a general analogy not only of deities and spirits, but even of holy places and their mode of worship. But the fact is that they each took the originally common stock of notions and conceptions, clad more or less in mythical garb, and utterly transformed it, superadding to it from time

to time according to their own distinct nationality. It is here, however, that their characteristic traits come out in as forcible a contrast as they do in every other relation of life, in their art and culture, in their states and families. While to the Hellenes the individual was the chief end of all things, and the state existed for the citizen, and the ideal was the *Kulokaguthia*, the beautiful, good, the Romans imposed, as the highest duty, submission to authority—the son to the father, the citizen to the ruler, and all to the gods. To them, only that which was useful appeared good. Idleness was not to be tolerated in a community where every single member only existed as far as it contributed to the greatness and aggrandizement of the commonwealth. Hence, with them, a rational thoughtfulness, and a grand and awful austerity in their relations to men and gods; while the Greeks treated both with joyful serenity. The Greek invested his gods with human attributes, and then surrounded them with a halo of highest splendor and most glorious divine beauty; but he constantly modeled and remodeled them, until they reached the acme of beautiful perfection, as would the painter and the sculptor with their work. The Roman, on the other hand, cared nothing for the outward form of his idealized notions—the notions themselves, mere fundamental ideas, were his sole object of veneration. The Greeks made everything concrete, corporal, and individual; the Romans, abstract and general. The Greeks could only worship allegories; the Romans, abstractions. Hence, also, their utter discarding of many of the myths common to the whole Indo Germanic stock, the unmarried and childless state of their gods, who, moreover, wanted no food, and did not wander about among men, as did the Indian and the Hellenic. As in the late Midrash, which has partly found its way into Christianity, there is a heavenly Jerusalem right over the earthly Jerusalem, in which all things below were reproduced in an exact but most ideal and divine manner. Thus, the Roman pantheon was the precise counterpart of the Roman world as it existed in reality. Every man, and thing, and event, and act had a corresponding tutelary deity, that came and went with the special individual, phenomenon, or event; and eternal gods were those only that represented certain great unchanging laws of nature. The angels of the legendary lore of later Judaism and early Christianity, that protect special nations, were with the Romans the gods of these nations, and entered, as their special numina, the divine commonwealth of the Romans simultaneously with the admission of these nations into their own pale or freedom.

As long as the grand old Roman simplicity of manners, the frugality of domestic life, the indefatigable pursuit of agriculture, trade, and commerce lasted—and all of these were well characterized by the deep reverence paid to gods (albeit not in the highest scale of divine order), who presided over the house, the field, the forest, mercantile enterprise, and the like, Vesta, the Penates, the Silvani, the Lares or Lases, Hercules or Hercules (a native Italian deity, the god of the inclosed homestead [compare Jupiter *herceus*] apparently distinct from the Greek Heracles) as the god of property and gain, whose altar, as god of faith (*Deus fidius*), was as frequently to be met with as those of the goddess of chance (Fors, Fortuna), and the god of traffic (Mercury)—so long did Roman religion, properly so called, retain its firm hold over the people's minds, and its influence cannot well be overrated. But when the antique austerity, the clden spirit of grand independence, the unceasing hard work that steeled body and soul, had given way to the lazy luxurious ease of later times—then Roman religion ceased to exist in reality, and over its ruins rose a mad jumble of unbelief, Hellenism, sectarianism, and oriental creeds. The ancient *religio*, the binding faith, which had excited the admiration and astonishment of the Greeks, had waned, and in proportion with the unbelief rose the pomp, and stateliness, and luxury of public worship. To the hierarchy of augurs, oracle-keepers, and pontifices were superadded special banquet-masters for the divine banquets. The priests more and more freed themselves from taxes and other public burdens, and the custom of perpetual endowments for religious objects crept in, as their influence waxed stronger and stronger. "Pious services" became as much an item of domestic expenditure as cook's and nurse's wages. Penny collections for the "mother of God" were gathered on certain fixed days by the sound of fife and drum played by priests in oriental garb, headed by a eunuch, from house to house, and the whole substance of Roman faith was transformed into an unwieldy mass of dark, groveling mysticism and shameless profligacy, presided over by wretched gangs of uneducated and unprincipled priests. How this state of things favored the gradual introduction of Judaism and Christianity into the dying days of imperial Rome, has been briefly sketched in Gnostics (q.v.). Constantine the great abolished the last outward trace of Roman religion by proclaiming Christianity as the state religion.—For the greater part of the gods and goddesses mentioned, see special articles. See also GREEK RELIGION, ETRURIA, PELASGIANS, etc. For a fuller account of the whole subject, the reader is referred to Mommsen's *History of Rome* (Eng. transl. Lond. 1864).

ROMANS, a t. of France, in the department of Drome, stands on the right bank of the Isère, 14 m. n.e. of Valence. A bridge, founded in the 9th c., connects Romans with the small town of Peage on the left bank of the river. Romans owes its origin to an important abbey, founded in the 9th c., by St. Bernard, archbishop of Vienne, and by a nobleman named Romain, who gave his name to the town. Silk and woolen fabrics are largely manufactured, and a very active general trade is carried on. Pop. '72, 9,893; '76, 11,024.

ROMANS, EPISTLE TO THE, in a doctrinal point of view, the most profound and elaborate composition of St. Paul. That it proceeded from the pen of the great apostle of the Gentiles has never been seriously doubted by any competent scholar. Much discussion has taken place regarding the *composition* of the church at Rome, and—connected therewith—the design or object of the epistle. Were the members of the church Jewish or Gentile Christians? The general opinion of commentators is that the church was a mixed congregation, the majority of members being probably of pure Gentile descent, and the minority Jewish Christians, who perhaps formed the original nucleus of the church. Dr. Jowett, in his *Epistles of St. Paul to the Romans, Galatians, and Thessalonians*, suggests that the phenomena of the text—for example, the frequent appeals to the authority of the “law” addressed to the Gentiles—may be best explained on the hypothesis that the apostle is speaking to a Gentile congregation which had passed through a phase of Jewish proselytism. The great value of the Epistle to the Romans consists in this, that it exhibits what may be called the *rationale* of Christianity. The immediate object of the apostle was probably nothing more than to prevent an outbreak in the church at Rome of those violent antipathies of religious sentiment which had shown themselves elsewhere (for instance, at Corinth), and had produced such disastrous consequences; but with a view to the more complete accomplishment of this object, he takes a broad *ethical* view of human nature, and finds all men—Jews and Gentiles alike—to be estranged from God, and in need of pardon and reconciliation. He does not underrate the advantages which his Jewish countrymen possessed—nay, he extols them; but he points out at the same time that the “oracles” or “law” could not make the Jews holy; they could only condemn them for being unholy. The Gentiles were declared guilty not less decisively by their own consciences—the law was plainly enough “written in their hearts.” Hence Paul’s grand argument, that if men are to stand as “righteous” in the sight of God, it cannot be by their “works,” but in virtue of a divine justification graciously vouchsafed to them, and received into their hearts by an act of faith. This leads him to unfold the purpose and significance of Christ’s work, to dilate on the “freeness” of God’s grace toward “sinners.” He concludes by predicting the conversion of his “kinsmen according to the flesh,” exhorting the Gentiles to humility, charity, mutual forbearance, and the practice of all the Christian virtues. The epistle is believed to have been written from Corinth during Paul’s third missionary journey, about 58 A.D. The commentaries upon it, or upon special chapters, are innumerable; and almost all the great doctrinal controversies that have agitated Christendom owe their origin to it.

ROMANS, EPISTLE TO THE (*ante*), opens with affirming, 1. That the gospel is of divine authority, and had been promised in the Old Testament; 2. That in the person of Jesus Christ the divine and human natures are united; 3. That the righteousness of God by faith which is revealed in the gospel makes it the power of God unto salvation. I. This proposition begins the doctrinal part of the epistle, which shows, 1. That all men need God’s way of salvation. (1.) The Gentiles, having sufficient light by nature to render them without excuse for transgression, manifest their depravity in flagrant vices. (2.) The Jews pronounce their own condemnation when, doing the same things for which they condemn others, they boast in the law, which forbids sin, and in the Scriptures, which affirm the universal prevalence of transgression. Jews and Gentiles, therefore, being sinners, no man can be saved by the deeds of the law. 2. God offers all men salvation through the death of Christ. This provision had been foretold from the beginning, and even Abraham had been saved through faith in it. 3. The results of justification by faith are: peace with God, access into a state of grace, a joyful hope of glory, present joy even in tribulation as promoting growth of Christian character, and assurance that since the love of God had been exercised toward sinners in giving Christ to die for them, much more by his living again would the blessings of salvation be secured. These blessings are great and abounding, being, as coming through the righteousness of one man, analogous to the ruin which had come on mankind through the transgression of one man; yet far transcending that. 4. This grace to sinners does not tolerate sin, but insures its destruction in all who truly believe. The very profession of reliance on Christ is a promise to forsake sin; and the exercise of faith in him, is the beginning of a new life which is to be perfected in holiness. Yet sin does not die easily, or soon. A conflict between the old nature and the new is waged, often with increasing strenuousness in proportion as the new grows strong, so that believers, if depending on themselves, would be in despair; but through Christ their deliverance is sure. 5. Therefore to true believers there are present manifold blessings: release from condemnation, spiritual life, adoption as children of God, joint-heirship with Christ in all that belongs to God, even though as creatures they still continue, in common with others, subject to the vanity of the present life; yet they have the sure hope of being saved from it, and of their creature nature attaining the glorious liberty of God’s children. In the mean time, the spirit of God dwelling in them helps their infirmities; all external things, they know, are so administered as to work together for good to them; and the love of God, which did not spare his own son, will triumph for them and in them over all actual and possible hostile things. 6. To this doctrinal exhibition an objection of great apparent force is urged. The Jews, through whom historically the one way of salvation in the gospel has been manifested to men, are, as a nation, unbelievers in their own Messiah, and consequently,

are rejected of God. Paul admits the fact, declaring that he endured great and constant sorrow for them as his kinsmen according to the flesh whose case had once been his own when, in his ignorant unbelief, he used to imprecate on himself a curse from Christ: he recounts their ancient privileges and honors, yet declares that God's supreme purpose, itself a part of a universal plan, having from the beginning respect to a portion of the people, had been accomplished: that the rejection of the unbelieving portion will not be perpetual, because ultimately they shall become a believing people; and that, as through their unbelief salvation had gone out to the Gentiles, so, in the fullness of time, their faith and restoration will be to the world as life from the dead. II. The practical part of the epistle flows logically from the doctrinal exhibition.

ROMANSH or RUMONSH. See ROMANIC LANGUAGES, *ante*.

ROMANS, KING OF THE, strictly the title of the prince elected during the lifetime of a German emperor to be his successor. The title expired with the Holy Roman Empire in 1806. Up to the time of the coronation of Otho I. by pope John XII. in 962, the German sovereigns called themselves kings of Germany, and also (though incorrectly) kings of the Romans. Joseph II. was the last to bear the title.

ROMANTIC SCHOOL, the name first assumed in Germany, about the beginning of the present century, by a number of young poets and critics, A. W. and Fr. Schlegel, Novalis, Ludwig Tieck, Wackenroder, etc., who wished to indicate by the designation that they sought the essence of art and poetry in the wonderful and fantastic—elements that pre-eminently characterized the Romance literature of the middle ages. Their efforts were directed to the overthrow of the artificial rhetoric and unimaginative pedantry of the French school of poetry, even then influential, and to the restoration of a belief in the mystery and wonder that envelop the existence of man—a belief that had been rudely assailed and mocked by the prevailing materialism in all departments of thought. Thus, their purpose was twofold—it was in part æsthetic, and in part religious. As poetical reformers, the Romantic school in Germany unquestionably exercised a most beneficial influence; but as religionists—though their aim was intrinsically high and noble—they more or less consciously subserved the designs of a reactionary government, and so came to be hated and distrusted by the liberal politicians and thinkers of Germany.—See Eichendorff's *Ueber die Ethische und Religiöse Bedeutung der Neuern Romantischen Poesie* (Leip. 1847); H. Heine's *Zur Geschichte der Neuern Schönen Literatur in Deutschland* (Hamb. 1835); Hettner's *Die Romantische Schule* (1850); R. Haym's *Die Romantische Schule* (1870); and the Danish work of Brandes (1873).—Between twenty and thirty years later a similar school arose in France, and had a long struggle for supremacy with the older classic school. It was victorious, but not wise, and, except in a few instances—such as Lamartine and Victor Hugo—it has rushed into excesses of caprice both literary and moral, which have stamped it with a revolutionary rather than a reformatory character.—See Huber's *Die Romantische Poesie in Frankreich* (1832); Tenuet's *Prosodie de l'École Moderne* (1844); Gautier's *Histoire du Romantisme* (Par. 1874).

ROMAN WALLS. Traces are found in Great Britain of four great walls built by the Roman conquerors. Two were built by Agricola, the first in A.D. 79, and the second in A.D. 81, extending from the frith of Forth to the frith of Clyde. As this proved insufficient to keep back the northern barbarians, Hadrian in A.D. 120 finished the most famous of all the walls, from the Solway to Newcastle on the Tyne. This was 68 English m. in length. In A.D. 209 Severus built another wall a few yards above that of Hadrian, which was guarded by 10,000 men.

ROME. The design of this article is to furnish the reader with a brief outline of the ETHNOLOGY and HISTORY of ancient Italy, in so far as these are not already discussed or described under particular heads, to which reference will be made. As the Roman state gradually conquered and incorporated with itself the other states and territories of the Italian peninsula, and as these (in general) figure separately in history only during the process of this subjugation, it will be most convenient to consider them here.

Ethnology.—In the earliest times we find in Italy five distinct races; three of which (IAPYGIANS, ETRUSCANS, and ITALIANS) may, in a restricted sense, be termed "native," inasmuch as we do not meet with them elsewhere; and two, GREEKS and GAULS, "foreign;" inasmuch as their chief settlements were not in Italy, but in Greece and Gallia. But, ethnologically, this distinction is arbitrary. There is no reason for believing that the first three races were indigenous, and the last two immigrant; the analysis of their languages, or of such fragments of their languages as survive, leads strongly to the conclusion that all were alike immigrant, and that in this respect the only difference between them is one of time.—1. *The Iapygians.*—This race, monuments of which in a peculiar language (as yet undeciphered), have been found in the s.e. corner of Italy—the Messapian or Calabrian peninsula—is in all probability the oldest.—2. *Etruscans.*—The origin of this mysterious people is certainly one of the most interesting, if also one of the most insoluble problems in history. It is not, however, necessary to say anything about them here, as their history, character, and civilization are handled at length in the article ETRURIA.—3. *Italians.*—At what period the earliest immigrations into Italy of the so-called "Italian" races—the Latins and Umbr-Sabellians, took place, it is wholly impossible to tell; but it was undoubtedly long before the Etruscans had

settled in Etruria. They were by far the most important of the various races that inhabited the peninsula; in fact, the entire historical significance of Italy depends upon them; and therefore it is fortunate that their ethnological origin and affinities are capable of the most certain demonstration. An investigation of their language, subdivided indeed into numerous dialects, often widely differing but fundamentally the same, has resulted in the discovery that they belong to the great Aryan or Indo-Germanic family (see **ARYAN RACE** and **ARYAN LANGUAGES**), and are in particular closely allied to the Hellenes. We are therefore warranted in affirming that at some very remote period a race migrated from the east, embracing the ancestors of both Greeks and Italians. By what route they proceeded, or at what point they diverged, we can only conjecture, for the problem is not yet solved whether the Hellenes reached Greece by way of Asia Minor or from the regions of the Danube; but, at any rate, Mommsen's statement that "the Italians, like the Indians, immigrated into their peninsula from the north," may be regarded as certain. There is ground for believing that the Latins were the first members of the Italian family to enter Italy, and that, having crossed the Apennines, they spread themselves to the s. along the western coast, driving the Iapygians before them, and finally cooping them up in the Calabrian peninsula—the heel of the boot. But this conquest belongs to prehistoric ages, and the original Latins of Campania, Lucania, Bruttium, perhaps even Sicily (i.e., the races spoken of in classic legend as the Itali, from whom the peninsula received its name, the Margetes, Ausones, Siculi, etc.), were themselves in the course of time so thoroughly Hellenized by the influence of the rich and powerful Greek colonies planted on their coasts (see **MAGNA GRÆCIA**), or so overwhelmed by the successive invasions of Samnite hordes, that nearly every trace of a primitive Latin nationality has disappeared, and only here and there a solitary linguistic or legendary relic survives to indicate faintly the path which conjecture should pursue. It was only in Latium proper, where no Greek colonies were founded, and where the fortune of war was in its favor, that the Latin branch of the Italian race firmly rooted itself. There, however, it did flourish, and petty as the district might seem—not more in all than 700 sq.m.—it was incomparably the most important in the peninsula, for within its limits rose those seven hills on which a city was to be built that was destined to subdue and govern the world. The other branch of the "Italian" stock, the Umbro-Sabellian, must have entered Italy at a later period than the Latin. Its advance along the central mountain-ridge—the Apennines—from n. to s. can still be traced; and its last phases—i.e., the conquest of Campania and the other southern districts of the peninsula by the Samnite highlanders—belong to purely historical times. The oldest members of this branch are probably the Sabines (q.v.), who seem to have fixed themselves in the mountainous region to the n.e. of Rome, and are regarded as the progenitors of that multitude of tribes which we find occupying the central portion of Italy—the Picentes, Peligni, Marsi, Æqui, Vestini, Marrucini, Frentani, Samnites—perhaps also the Volsci and Hernici.—4. *Gauls*.—To a period considerably later and comparatively historical, belong the settlement of the Gauls in the n., and of the Greeks in the s. of Italy. The former a branch of the Celtic race, itself now ascertained to be also a member of the great Aryan family (see **CELTIC NATIONS**), and therefore allied, however distantly, to the other Italian races, had, for ages before history begins, fixed themselves in the region now known as France. Finding further progress westward barred by the waves of the Atlantic, and being of a restless and excitable disposition, they turned their steps e. and s.e., broke over the Alps (according to the legend in Livy, by the little St. Bernard) some time during the 3d c. after the founding of Rome, and poured down into the plains of the Po. The first Gallic tribe that made its appearance on the soil of the peninsula is said to have been the Insubres, whose capital was Mediolanum (Milan); then followed the Cenomani, whose headquarters were Brixia (Brescia) and Verona, and afterward numerous kindred hordes, among the latest and most powerful of whom were the Boii (q.v.) and Senones, who forced their way across the Po, and effected a lodgment in the modern Romagna, occupying (besides an inland district) the coast of the Adriatic as far s. as Ancona. Hence, in ancient times, the whole of northern Italy was for a long period known as Gallia Cisalpina (Gaul on *this*, i.e., the Italian side of the Alps), to distinguish it from Gaul proper, which was called Gallia Transalpina. Gallia Cisalpina was again subdivided into two parts by the river Padus (Po); the northern being named Gallia Transpadana, and the southern (the country of the Boii and the Senones), Gallia Cispadana. Various other tribes or peoples are found in the n. of Italy, such as the Ligurians (along the gulf of Genoa), and the Veneti (in modern Venetia), regarding whose origin—in the absence of all linguistic and other memorials—we are utterly in the dark.—5. *Greeks*.—The other people which we have distinguished as "foreign" was the Greek. There is, however, this distinction to be observed, that the Greeks were not (like the Gauls) barbarians; they did not swoop down upon the southern shores of Italy (like the Norse pirates on the coasts of England and France) to plunder and devastate; nor did they force their way into the interior and dispossess the native inhabitants; they merely colonized the coasts, built cities, and carried on commerce. Through them it is probable the Romans acquired their earliest notions of the Greek literature, philosophy, and cultus. For further information concerning them, we refer the reader to the article **MAGNA GRÆCIA**, and to such of their cities as have received separate treatment.

Primitive Social Condition of the Latins.—With this brief introductory sketch of the various races that inhabited Italy in historical or prehistorical times, we may now

revert to the Latins, with whom we have at present more particularly to do. What was the extent of their civilization, or how far their social organization had proceeded when they finally settled in the "broad plain" (*Lătium*, connected probably with *lătus*, broad; *lătus*, a side; Gr. *platus*; Eng. *flat*) that stretches westward from the Alban hills to the sea, may be conjectured, but cannot be positively ascertained. We know, indeed, that long before they had set foot in Italy, before even they had branched off from their Hellenic brethren, they had ceased to be mere nomads, or wandering shepherds. The evidence of this fact lies in their language. Not only do the names of the oldest Latin nations, as the *siculi* ("the sickle-bearers" or "reapers"), and the *osci*, or *opsci* ("field-laborers"), clearly prove the antiquity of Italian husbandry; but the oldest agricultural terms are actually common to both Latins and Greeks (e.g., Lat. *ager*, Gr. *agros*; Lat. *aro*, *aratrum*, Gr. *arō arotron*; Lat. *ligo* (a hoc), Gr. *luchaino*; Lat. *hortus*, Gr. *chortos*; Lat. *mīlium*, Gr. *melinē*; Lat. *rapa*, Gr. *raphanis*; Lat. *malva*, Gr. *malachē*; Lat. *vinum*, Gr. *oinos*). Moreover, the form of the plow was the same among both peoples, as also their mode of cutting and preparing the grain; many of the usages of social life; the oldest methods of measuring the land; and the style of their national dress—the Latin *tunica*, corresponding exactly with the Greek *chiton*, while the Latin *toga* is only a fuller *himation*. Their method of building was also the same. Such evidence (and it could easily be extended, must be regarded as conclusively showing that before the Latino-Italians entered Italy, they had been accustomed to till the ground, to make wine, to keep gardens, to build houses, and to decently clothe themselves. As to their social organization, less can be said. It appears, however—judging from the general bearing of the most ancient traditions, as also from the features exhibited in historical times—that at a very early period, and from causes of which we are now absolutely ignorant, they had begun to develop the germs of what may be called "state-life." As among their Hellenic brethren, the original foundation of their social constitution was "households" (Gr. *oikiai*, Lat. *vici* or *pagi*, from *pingere*, to "fix" or "drive;" hence "to build"); these, either by ties of blood, or by nearness of locality, were aggregated into clans, and their dwellings formed clan-villages (thus *pagus*, which probably meant at first only a single "household," came, by a natural transition, to denote a collection of households—a hamlet, or a village). Such clan-villages were, however, not regarded as independent societies, but as parts of a political canton or community—the *civitas* or *populus*. Each canton or *civitas* possessed a local center or place of assembly, where justice was administered at regular intervals, where markets and sports were held, and religious rites celebrated, and which was besides fortified to serve as an asylum or place of refuge for the inhabitants of the open hamlets and their cattle in time of war. Such a center was termed the *capitolium*, i.e., "the height," from being originally fixed on a height or hill-top, and corresponded to the *akra* of the Greeks. Round this stronghold of the canton, which formed the nucleus or beginning of the earliest Latin towns, houses gradually sprung up, which in their turn were surrounded by the *oppidum* ("work," from *opus*), or the *urbs* ("ring-wall," connected with *urens*, *curvus*, *orbis*); hence, in later times, *oppidum* and *urbs* became, naturally enough, the recognized designations of town and city. Evidence is not wanting to justify this view of the genesis of the Latin towns. In the ruder and more mountainous districts of central Italy, occupied by the Marsi, Æquicoli, etc., the system of living only in open villages prevailed down even to the close of the empire, and there the Roman antiquarians found, to their inexplicable surprise, those solitary strongholds with their mysterious ring-walls, which, on the soil of Latium proper, expanded into towns, but in the recesses of the Apennines never advanced beyond their original design.

The sites of the oldest of these cantonal centers or primitive towns in Latium are to be sought for on the slopes of the Alban hills, where the springs are freshest, the air most wholesome, and the position most secure. Tradition (which makes Alba Longa the oldest seat of a Latin community) is here in accordance with natural probability.* On the same slopes lay Lanuvium, Aricia, and Tusculum, to the great antiquity of which ancient tradition bears testimony in many ways: on the offshoots of the Sabine range, in the east of Latium, stood Tibur and Praeneste; in the plain between the Sabine and Alban ranges, Gabii, Labici, and Nomentum; on or near the coast, Laurentum and Lavinium; and on the isolated hills overlooking the Tiber (the boundary between Latium and Etruria), the frontier town of Rome. How many cantons were originally in Latium, it is neither possible nor important to know. Tradition mentions 30 sovereign or politically independent communities (with Alba Longa at their head), which formed the famous Latin league. The historical order of their constitution is a point regarding which we are equally ignorant, but there is reason to believe that the Roman canton, or at least its capital, the town of Rome, was among the latest political organizations of the Latins. The history and fortunes of this canton we now proceed briefly to trace.

History of Rome during the Earliest or Regal Period.—According to the myth of Romulus, Rome was an offshoot from Alba Longa, and to the biography of that hero

* It is perhaps hardly necessary to remark that the story of the foundation of *Alba Longa* by *Ascanius*, the son of *Aeneas*, and the introduction of a Tyrrheno-Trojan element into the primitive history of Latium, is an utterly worthless fable.

we refer the reader for an outline of the ancient legend; but the most rational view of the city's origin is that which is suggested by a consideration of its site. It probably sprang into existence as a frontier defense against the Etruscans, and as an emporium for the river-traffic of the country; but whether it was founded by a common resolve of the Latin confederacy, or by the enterprise of an individual chief, is beyond the reach even of conjecture. The date fixed upon for the commencement of the city by the formation of the *Pomœrium*, viz., April 21, 753 B.C., is, of course, perfectly valueless in its precision. We know and can know nothing whatever on the point. The three "tribes," Ramnians, Tities, and Luceres, who appear in the Romuleian legend as the constituent parts of the primitive commonwealth, suggest the idea that Rome (like Athens) arose out of a *synoikismos* or amalgamation of three separate cantons; but Mommsen rejects as "irrational" the common opinion that these cantons represent different races, and that the Romans were a "mongrel people," made up of Latins, Sabines, and Etruscans, with perhaps a dash of Hellenic and imaginary "Pelagic" blood in their veins! The existence of a Sabine element, represented by the Tities, is indeed admitted; but its introduction is thrown back to a period long anterior to the foundation of the city, when the Roman clans were still living in their open villages, and nothing of Rome existed but its "stronghold" on the Palatine. Nor is there anything to indicate that it materially affected the Latin character, language, polity, or religion of the commonwealth which was subsequently formed.

The motives which probably led to the building of Rome also led to its rapid development, so that the great peculiarity of the Roman, as compared with the other Latin cantons, is the prominence which its urban life assumed in the earliest period. No doubt the Roman continued to manage his farm in the cantonal territory; but the insalubrity of the Campagna, as well as the advantages of river-traffic, and the necessity for watchfulness imposed upon all frontier towns in rude ages, must ever have acted as an inducement to him to take up his residence as much as possible in the city. The consequence was that the Roman became essentially a "citizen," while the other Latins remained essentially "rustics." So markedly is this the case, that the beginnings of Roman history—if the ancient legend may be so designated—are mainly records of its urban expansion and political growth. That the Palatine hill was the oldest portion of the city is attested by a variety of circumstances. Not only does it hold that rank in the Romuleian legend, but on it were situated the oldest civil and religious institutions. The Romuleian myth of the establishment of an asylum on the Capitoline (see *CAPITOL*) for homicides and runaway slaves, with all its famous consequences—the *Rape of the Sabine Women*, the wars with the Latins of Cœnina, Antemne, and Crustumæ, but especially with the Sabines of Cures under their king Titus Tatius, the tragic fate of Tarpeia, and the fine feminine valor of the ravished maidens, who had learned to love their captors, is historically worthless; except, perhaps, so far as it shows us how from the beginning the Roman burghers were engaged in constant feuds with their neighbors for the aggrandizement of their power. The entire history of the "regal period," in fact, has come down to us in so mythical and legendary a form, that we cannot feel absolutely certain of the reality of a single incident. That such personages as Numa Pompilius, Tullus Hostilius, Ancus Martius, Lucius Tarquinius Priscus, Servius Tullius, and Lucius Tarquinius Superbus, ever existed, or, if they did, that the circumstances of their lives, their institutions, their conquests, their reforms, were as the ancient narrative describes them, are things which no critical scholar can believe. The destruction of the city records by the Gauls, when they captured and burned Rome in the 4th c. B.C., deprived the subsequent chroniclers of authentic information in regard to the past, and forced them to rely upon treacherous reminiscences, on oral tradition, on ballads, and on all the multifarious fabrications of a patriotic fancy, that would naturally seek compensation for political disaster in the splendor with which it would invest its primeval history. The utmost reach, therefore, to which our knowledge can attain, is to form some general idea—mainly by inference from the institutions that we find existing in later times—of the course that social and political progress followed in the Roman commonwealth.

From the very beginning of the city—and probably long before—the inhabitants were divided into two orders (exclusive of "slaves")—viz., householders and their dependents, better known perhaps as "patricians" (from *pater*, a father) and "clients" (i.e., "listeners," from *œvere*, "to listen"). The former alone possessed political—i.e., burgess-rights. It was they who exclusively constituted the *populus* ("the people"); while the clients had no political existence whatever. How this latter class originated we do not know, but "superiors" and "inferiors" exist everywhere, and there is really nothing wonderful in the phenomena, except the rigor of their political subjection. In a thriving community like the Roman, which seems to have always held a somewhat isolated and antagonistic position to the other Latin cantons, new-comers, such as refugees and the like, would be frequent; and these alien settlers, it is clear, never obtained (except under very special circumstances) the privileges of the original Roman families. That the clients formed a body essentially different from the *plebs* is not true, and seems based merely on the mythical account of what followed the destruction of Alba Longa by Tullus Hostilius. The name *plebs* (i.e., "the multitude," from the same root as *pleo*, I fill, *plenus*, full; with which is perhaps connected the other Latin word *vulgus*, Eng. *folk*), is doubtless, as its signification indicates, of later origin than *clientes*; but

both are applicable to the same persons, who were called "listeners," in reference to their being dependents on the different burgess-households, and the "multitude," in reference to their want of political rights. The constitution of the state was simple. All the burgesses were politically on a footing of equality. From their own ranks was chosen the king or "leader" (*rex*), who was therefore nothing more than an ordinary burgess—a husbandman, a trader, a warrior, set over his fellows. But it must at the same time be observed that his authority was great, for the Roman state was based on the Roman household, and something of the absoluteness of the *patria potestas* appears in the uncircumscribed nature of the regal powers. The *rex* held his office for life; he consulted the national gods; he appointed the priests and priestesses; he called out the *populus* for war, and led the army in person; his command (*imperium*) was not to be gainsaid, on which account on all official occasions he was preceded by "messengers" or "summoners" (*victores*, from *licere*, "to summon," though commonly given from *ligo*, "to bind"), bearing the "fasces" (axes and rods tied up together), the symbols of power and punishment; he had the keys of the public chest, and he was supreme judge in all civil and criminal suits. The Roman religion or *cultus* was from the first thoroughly subordinate to the authority of the state; and all that we can infer from the myth of Numa is that Rome perhaps owed its colleges of augurs and pontiff to the wisdom of some enlightened sovereign who felt himself at times embarrassed in his decisions on matters of religious and public law, and recognized how valuable might be the aid afforded him by a body of sacred experts. We may rest certain that originally the sole power was the regal, and that the subordinate magistracies found at a later time arose from a delegation of regal authority, rendered necessary by the ceaseless increase of state-business. "All the officials of the earliest period," says Mommsen (who has expounded this view with admirable sagacity in his chapter on the "Original Constitution of Rome"), "the extraordinary city-warden (*præfectus urbi*, who doubtless governed in the absence of the *rex*), as well as those who were probably nominated regularly, the 'trackers of foul murder' (*questores parricidii*), and the 'leaders of division' (*tribuni*, from *tribus*, part) of the infantry (*militēs*), and of the cavalry (*celerēs*), were mere royal commissioners, and not magistrates in the subsequent sense of the term." On the other hand, we may believe that the *senatus*, or council of the elders, from its very nature, was as old an institution as the monarchy itself. Among the very first things the "citizen-king" would do, would be to choose out of the ranks of his fellow-burgesses a number of experienced men to assist him with their counsel; but it is to be observed that this body possessed no coercive or constraining powers. They gave their advice when the *rex* chose to ask it; that was all. Yet, as the tenure of their office was for life, they necessarily possessed great moral authority; and it was only when the king, the senate, and the community were at one in regard to any important matter—a war, for example—that it was held to be righteous, and likely to be favored by the gods. The burgesses, or householders, were divided into *curiæ*—i.e., "wardships," connected probably with *cura* and *curare*, "to care for," rather than with *quiris*, and the Sabine *cures*, as Varro thinks. Ten households formed a *gens* (a "clan" or "family"); 10 clans, or 100 households, formed a *curia*, or wardship; and 10 wardships, or 100 clans, or 1000 households, formed the *populus*, *civitas*, or community. But as Rome was a *synoikismos* of three cantons, the actual number of wards was 30, of clans 300, and of households 3,000. Every household had to furnish one foot-soldier (hence the name *milēs*, the "thousandth walker," from *mil*, and *eo* (?) "to go"), and every clan a horseman and a senator. Each ward was under the "care" of a special warden (the *curiō*), had a priest of its own (the *flamen curialis*), and celebrated its own festivals. None but burgesses could bear arms in defense of the state (hence their designation, *populus*, "the warrior body," connected with *populari*, "to lay waste," and *popa*, "the priest, or priest's assistant, who felled the victim at the altar—the sacred butcher"). In the old litanies the blessing of Mars is invoked upon the *pilumnus populus* ("the spear-armed warrior-body"), and when the *rex* addressed them it was by the name of *quirites* ("lancemen," from *quiris*, or *curis*, a "lance," and *eo*, "to go"). The original Roman army, or *legio* (i.e., "the gathering"), was composed of three "hundreds" (*centuriæ*) of horsemen (*celerēs*—i.e., "the swift" or *flexantes*, "the wheelers"), under their divisional leaders (*tribuni celerum*); and three "thousands" of footmen (*militēs*), also under divisional leaders (*tribuni militum*), to whom are added a number of light-armed skirmishers (*velites*), especially "archers" (*arquiis*). The *rex*, as we have said, was usually the gen., but as the cavalry force had a col. of its own (*magister equitum*), it is probable that he placed himself at the head of the infantry. Military service was no doubt the prime duty of the Roman burgesses, but the king could impose upon them any labors that he reckoned necessary or advantageous to the welfare of the state, such as the erection of public edifices, the tilling of the royal demesnes, the execution of royal commissions, or the building of the city walls.

The "foreign policy" of Rome seems to have been aggressive from the first, and this character it retained as long as the aggrandizement of the state was possible. We have, it is true, no certain knowledge of the primitive struggles in which the enterprising and ambitious Roman burghers were engaged, but it appears from the legend that at a very early period the neighboring Latin communities of Antenne, Crustumium, Ficulnea, Medullia, Crenina, Corniculum, Cameria, Collatia, were subjugated. The crisis of the Latin war, however, was undoubtedly the contest with Alba Longa, in which that "sacred

metropolis" of Latium was destroyed, and its leadership passed to the conqueror. How deadly the struggle between the two was, may be inferred from the tragic details in which the legend abounds. As a rule, on the subjugation of a canton, the conquered inhabitants were allowed to remain in their open hamlets, but their *capitolium* was razed, their weekly market, their justice-court, their gods—everything, in short, strictly national—were removed to Rome, while they themselves were enrolled among the clients or plebs. But sometimes the inhabitants themselves, in whole or part, were transferred to Rome, and individuals or clans were even received into the ranks of the Roman burgesses, as in the case of Alba Longa. Some of the famous Roman *gentes* claimed to be of Alban descent—the Julii, Servilii, Quinctilii, Cloelii, Geganii, Curiatii, and Metilii. The wars with the Etruscans of Fidenæ and Veii—assigned, like the destruction of Alba Longa, to the reign of Tullus Hostilius—were apparently indecisive; those with the Rutuli and Volsci, however, were probably more fortunate; but uncertainty hangs like a thick mist over the ancient narrative. Even the story of the Tarquins, though it belongs to the later period of the monarchy, is in many of its details far from credible. Both Niebuhr and Mommsen consider "Tarquin the proud" a historical personage, and without accepting literally all the circumstances of the tradition, believe the general outline—his character, his exactions, his expulsion, and his desperate efforts for the recovery of the throne—to be trustworthy. The memory of such a monarch was likely to be preserved by the very strength of the hatred he excited, and an act so daring as his expulsion (which was at the same time the death-knell of a system of government that had prevailed for ages) could hardly be a mere invention, though it might be overlapped with fold upon fold of picturesque fiction. The view taken by Napoleon III. (see *Histoire de Jules César*, vol. i.), that the primitive monarchy had served its purpose, and had consequently to disappear, is perhaps not so erroneous as the oracular language of the imperial author would lead us to suppose. The aristocracy or *populus* had become so much more powerful than the individual *rex*, that they wished to possess *de jure* as well as *de facto* the supreme authority. The pride and tyranny of a Tarquin may very well have aided in furthering their designs.

Meanwhile a great internal change had taken place in Rome. This is usually designated the Servian "reform of the constitution," although the expression is calculated to mislead. There was nothing directly political in the "reform." It was only a reform in the burgesse-levy—i.e., in the mode of raising the army. Formerly, as we have seen, none but burgesses could bear arms in defense of the state; but the increase of the general population, caused partly by the annexation of the conquered Latin communities, and partly by time, had totally altered the relation in which the non-burgesses, or *plebs*, originally stood to their political superiors. The *plebs* could, of course, acquire property and wealth, and could bequeath it just as legally as the *populus*; moreover, such of the Latin settlers as were wealthy and distinguished in their own communities, did not cease to be so when they were amalgamated with the Roman "multitude." It was therefore felt to be no longer judicious to let the military burdens fall exclusively upon the old burgesses, while the rights of property were equally shared by the non-burgesses. Hence the new arrangement, known in Roman history as the formation of the *comitia centuriata*. When or with whom the change originated it is impossible to say. The legend assigns it to Servius Tullius, predecessor of Tarquin the proud; and it was in all probability the work of some kingly ruler who saw the necessity of reorganizing the national forces. That it cannot be regarded as a change brought about by party zeal, is obvious when we reflect that it conferred no rights, but only imposed duties on the plebeians. Its details were briefly as follows: Every Roman freeholder from the age of 17 to 60, whether patrician or plebeian, was made liable to serve in the army; but he took his place according to the amount of his property. The freeholders were distributed into five classes (i.e., "summonings," from *calare*, to "summon" or "call out"), and these classes, all of whom were infantry, were again subdivided into *centurie* ("hundreds"). The first class, which required to possess property valued at 100,000 ases, or an entire hide of land, furnished 82 "hundreds;" the second, property valued at 75,000 ases, or $\frac{3}{4}$ of a hide of land, furnished 20 "hundreds;" the third, property valued at 50,000 ases, or $\frac{1}{2}$ hide of land, furnished 20 "hundreds;" the fourth, property valued at 25,000 ases, or $\frac{1}{4}$ hide of land, furnished 20 "hundreds;" and the fifth, property valued at 12,500 ases, or $\frac{1}{8}$ hide of land, furnished 32 "hundreds." A single "hundred" was, moreover, added from the ranks of the non-freeholders, or *proletarii* (mere children-begetters), although it is possible that from the same order came the two "hundreds" of "horn-blowers" (*cornicines*), and "trumpeters" (*tibicines*), attached to the fifth class. Thus the infantry "hundreds" amounted to 175, that is 17,500 men, besides whom were 18 "hundreds" of *equites* ("horsemen") chosen from the wealthiest burgesses and non-burgesses; so that the Roman army now numbered in all nearly 20,000 men. We have stated that the original design of this new arrangement was merely military, but it is easy to see that it would soon produce political results. Duties and rights are correlative. The former suggest the latter, and create a desire for their attainment. Hence the Servian military reform paved the way for the grand political struggle between the patricians and the plebeians, which commenced with the first year of the republic, and only terminated with its dissolution.

The Roman Republic from its Institution to the Abolition of the Decemvirate.—1. *Internal*

History.—According to the legend, the expulsion of the Tarquins was mainly the work of their cousins, Junius Brutus and Tarquinius Collatinus, in revenge for the outrage on the honor of Lucretia, and was followed by the abolition of the monarchy. The date usually assigned to this event is 509 B.C. The story is intensely tragical, and if we must consider it poetry rather than fact, yet it may safely be taken as evidence that it was an unbridled lust of power and self-gratification that brought ruin on the Romano-Tuscan dynasty. Of course, we can make nothing definite out of the early years of the republic. Dates and names, and even events, must go for very little. Valerius Publicola or Poplicola, Sp. Lucretius, M. Horatius, Lars Porsenna (q.v.) of Clusium, Aulus Postumius, with the glorious stories of Horatius Cocles and the battle of Lake Regillus, will not bear to be scrutinized. We must content ourselves with the knowledge of historical tendencies and general results. The change from "kings" to "consuls" (*consules*, "those who leap together"—more generally, those who *act* together) was not intended to diminish the administrative power of the supreme rulers, but only to deprive them of the opportunity of doing harm—of becoming Tarquins; and this it effectually succeeded in doing, by limiting their tenure of office to a year, and by numerous other restrictions. (For an account of their original functions, and of the subsequent modifications which these underwent, see *CONSUL*.) It is believed to have been about this time, and in consequence of the new political changes, that the old assessors of the king, such as the *questores parvicii*, formally became standing magistrates instead of mere honorary counselors, and also that the priesthood became a more self-governing and exclusive body. During the regal period the priests were appointed by the king, but now the colleges of augurs and pontiffs began to fill up the vacancies in their ranks themselves, while the vestals and separate "flamens" were nominated by the pontifical college, which chose a president (*pontifex maximus*) for the purpose. The lapse of years ever increasing the quantity of sacred lore, also increased its importance, and the importance of those who specially studied it; and nothing comes out more clearly in the early history of the republic than the fact that the opinions of the augurs and pontiffs became more and more legally binding. This is to be connected with the fact that in every possible way the patricians or old burgesses—now rapidly becoming a mere *noblesse*—were seeking to rise on the ruins of the monarchy, and to preserve separate institutions for the benefit of their own order, when they could with difficulty longer exclude the *plebs* from participation in common civic privileges. In the details given us of the "Servian reform," we can easily discern a spirit of compromise, the concessions made to the plebeians in the constitution and powers of the *comitia centuriata* being partially counterbalanced by the new powers conferred on the old burgess body, the *comitia curiata*—viz., the right of confirming or rejecting the measures passed in the lower assembly. Toward the new assembly, therefore, it stood somewhat in the relation in which the house of lords stands to the house of commons, but the analogy must not be pushed too far; it is only general. The character of the senate altered under the action of the same influences. Although it never had been formally a patrician body—although admission to it under the kings was obtainable simply by the exercise of the royal prerogative, yet, practically, 299 out of the 300 senators had always been patricians; but after the institution of the republic, we are told that the blanks in the senate were filled up *en masse* from the ranks of the plebeians, so that of the 300 members less than half were *patres* ("full burgesses"), while 164 were *conscripti* ("added to the roll"), hence the official designation of the senators *patres et conscripti* ("full burgesses and enrolled").

As yet, however, it is to be observed the plebeians were rigorously excluded from the magistracies. They could vote—i.e., they could exercise legislative powers—but they had no share in the administration. None but patricians were eligible for the consulship, for the office of quaestor, or for any other executive function, while the priestly colleges rigidly closed their doors against the new burgesses. The struggle, therefore, between the two orders went on with ever-increasing violence. One point comes out very clearly from the narrative, however dubious we may be of the particular details, viz., that the establishment of the republic and the reconstitution of the burgess body, instead of allaying discontent, only fostered it. Power virtually passed into the hands of the capitalists, and though some of these were plebeians, yet they would seem to have preferred their personal money-interests to the interests of their order, and to have co-operated with the patricians. The abuse by these capitalists of the *ager publicus*—that is, such portion of the land of a conquered people as had been taken from them, annexed to the Roman state, and let out originally to the patricians at a fixed rent (see *AGRARIAN LAW*), together with the frightful severity of the law of debtor and creditor, the effect of which was all but to ruin the small plebeian "farmers," who constituted, perhaps, the most numerous section of the burgesses—finally led to a great revolt of the plebs, known as the "secession to the sacred hill," the date assigned to which is 494 B.C. On that occasion the plebeian farmer-soldiers, who had just returned from a campaign against the Volscians, marched in military order out of Rome, under their plebeian officers, to a mount near the confluence of the Anio with the Tiber, and threatened to found there a new city, if the patricians did not grant them magistrates from their own order; the result was, the institution of the famous plebeian tribunate (see *TRIBUNES*)—a sort of rival power to the patrician *consulate*, by means of which the plebeians, at least, hoped to be shielded from the high-handed oppressions of the wealthy. To the same period

belongs the *ædiles* (q.v.). A little later, the *comitia tributa* emerged into political prominence. This was really the same body of burgesses as formed the *comitia centuriata*, but with the important difference that the number of votes was not in proportion to a property classification. The poor plebeian was on a footing of equality with the rich patrician; each gave his vote, and nothing more. Hence the *comitia tributa* virtually became a plebeian assembly, and when the *plebiscitu* ("resolutions of the plebs carried at these *comitia*") acquired (as they did by the Valerian laws passed after the abolition of the decemvirate) a legally binding character, the victory of the "multitude" in the sphere of legislation was complete. From this time the term *populus* practically, though not formally, loses its exclusive significance; and when we speak of the Roman citizens, we mean indifferently patricians and plebeians. The semi-historical traditions of this period—for we are now (5th c. B.C.) beginning to emerge out of the mythical era—unmistakably show that the institution of the tribunate led to something very like a civil war between the two orders. Such is the real significance of the legends of Caius Marcus, surnamed *Coriolanus* (q.v.); the surprise of the capitol by the Sabine marauder, Appius Herdonius, at the head of a motley force of political outlaws, refugees, and slaves; the migrations of numerous Roman burgesses with their families to more peaceful communities; the street-fights; the assassinations of plebeian magistrates; the annihilation by the Etruscans of the Fabian *gens*, who had left Rome to escape the vengeance of their order for having passed over to the side of the plebeians; and the atrocious judicial murder of Spurius Cassius, an eminent patrician, who had also incurred the deadly hatred of his order, by proposing an agrarian law that would have checked the pernicious prosperity of the capitalists and overgrown landholders. Finally, 462 B.C., a measure was brought forward by the tribune C. Terentilius Ursa, to appoint a commission of ten men to draw up a code of laws for the purpose of protecting the plebeians against the arbitrary decisions of the patrician magistrates. A fierce, even a frantic opposition was offered by the patricians, and the ten years that followed were literally a period of organized anarchy in Rome. At length the nobles gave way, and the result was the drawing up of the famous code known as the *Twelve Tables*—at first *Ten*, to which two were afterward added—the appointment of the decemviri (q.v.), and the abolition of all the ordinary magistrates, both patrician and plebeian. The government by decemvirs, however, lasted only two years; according to tradition, the occasion of its overthrow was the attempt of the principal decemvir, Appius Claudius (q.v.) to possess himself by violence of the beautiful daughter of Virginius, a Roman centurion; but the real cause was doubtless political, though the cruel lust of a Claudius may have afforded the occasion; the result of which was the restoration of the predecemviral state of things—the patrician consulate and the plebeian tribunate.

2. *Eternal History*.—The external history of Rome, from the establishment of the republic to the abolition of the decemvirate, is, it need hardly be said, purely military. The Romans fought incessantly with their neighbors. Long before the close of the regal period they had acquired, as we have seen, the leadership of Latium, and in all the early wars of the republic they were assisted by their allies and kinsmen; sometimes also by other nations—as, for example, the Hernicans, between whom and the Romans and Latins a league was formed by Spurius Cassius in the beginning of the 5th c. B.C. The most important of these wars were those with the southern Etruscans, especially the Veientes, in which, however, the Romans made no way, and even suffered terrible disasters, of which the legend concerning the destruction of the Fabian *gens* on the Cremera (477 B.C.) may be taken as a distorted representation; the contemporaneous wars with the Volscians, in which Coriolanus is the most distinguished figure; and those with the Æqui (458 B.C.), to which belongs the fine legend of Cincinnatus (q.v.).

From the Abolition of the Decemvirate to the Defeat of the Samnites, and the Subjugation of all the "Italians" (449-265).—1. *Internal History*.—The leading political features of this period are the equalization of the two orders, and the growth of the new aristocracy of capitalists. After the abolition of the decemvirate, it would seem—judging from the course of events—that the whole of the plebeian aristocracy, senators and capitalists (from motives of selfish aggrandizement) combined with the "masses" of their order to make a series of grand attacks on the privileges of the old Roman noblesse. The struggle lasted for 100 years; and ended, as it could only end, by the removal of all the social and political disabilities under which the plebeians had labored—though the stratagems and artifices to which the old aristocracy had recourse proved the reluctance with which they succumbed to fate. First in 445 B.C., only four years after the fall of the decemvirs was carried, the *lex Canuleia*, by which it was enacted that marriage between a patrician and plebeian should be legally valid. At the same time, a compromise was effected with respect to the consulship. Instead of two patrician consuls, it was agreed that the supreme power should be intrusted to new officers termed "military tribunes with consular power," who might be chosen equally from the patricians or plebeians. Ten years later (435 B.C.) the patricians tried to render the new office of less consequence by the transference of several of the functions hitherto exercised by consuls to two special patrician officers named *censors* (q.v.). The "censorship," Mommsen remarks, "gradually became the palladium of the aristocratic party, less on account of its financial influence, than for the sake of the right annexed to it of filling up vacancies in the senate and in the equites." In 421 B.C., the quaestorship (see QUÆSTOR) was thrown open

to the plebeians; in 368 B.C., the mastership of the horse; in 356 B.C., the dictatorship (see *Dictator*); in 351 B.C., the censorship; in 337 B.C., the praetorship (see *Praetor*); and in 300 B.C., the pontifical and augurial colleges. These victories were not all won without the shedding of blood. How great was the exasperation of the patricians may be estimated from the story of Spurius Maclius, the rich plebeian, who was murdered simply because in a season of famine he sold corn at a very low price to the poor.

The only effect, it is to be observed, of these political changes was to increase the power of the rich plebeians; and consequently, the social distress continued to show itself as before. No genuine national concord was possible so long as *that* remained unmitigated. Efforts were repeatedly made by individuals to remedy the evil, but without success. Such were the attempts of the tribunes Spurius Maelius and Spurius Metilius (417 B.C.) to revive the agrarian law of Spurius Cassius; and of the noble and patriotic patrician, Marcus Manlius, who, though he had saved the capitol during the terrible Gallic siege, was hurled from the Tarpeian Rock (384 B.C.), on the customary charge, as groundless in his case as it was base, of aspiring to the monarchy; but at length (367 B.C.), after a furious struggle of eleven years, the famous Licinian rogations (see *AGRARIAN LAW*) were carried, by means of which it was hoped that an end had been put to the disastrous dissensions of the orders. Thus, at least, we interpret the act of the dictator Camillus, who raised a temple to the goddess *Concord*, at the foot of the capitol.

That these laws operated beneficially on the class in whose interest they were passed, viz., the plebeian-farmers or middle class of the Roman state, is unquestionable; but events proved that they were inadequate to remedy the evil, and after a time they ceased to be strictly enforced. On the other hand, there can be as little doubt that, owing partly to these changes, and still more to the splendid and far-reaching conquests achieved in Italy during this period of internal strife by the Roman arms, the position of the plebeian farmer was decidedly raised. Not only were the "general coffers filled" by the revenue drawn directly or indirectly from the subjugated lands, so that a *tributum* (a forced loan) seldom required to be enforced at home, but the numerous colonies which Rome now began to send forth to secure her new acquisitions, consisted entirely of the poorer plebeians, who always received a portion of the land in the district where they were settled. The long struggle between the two orders was thus virtually at an end; but the date usually assigned to the termination of the strife is 286 B.C., when the *lex Hortensia* was passed which confirmed the Publilian laws of 339 B.C., and definitely gave to the *plebiscita* passed at the comitia of the tribes, the full power of laws binding on the whole nation. Gradually, however, by steps which we have not room to trace, the importance of the popular assemblies declined, and that of the senate rose. This was owing mainly to the ever-increasing magnitude of the Roman state, and to the consequent necessity of a powerful governing body. The senate, it will be remembered, originally possessed no administrative power at all, but now it commenced a series of vast usurpations of which the best defense is that they excited no opposition among the community. Every matter of general importance—war, peace, alliances, the founding of colonies, the assignation of lands, building, the whole system of finance—came under its supervision and authority. Nor, on the whole, did it prove itself the unworthy arbiter of a nation's destinies. It was not a self-elected oligarchy, but was rather composed of the ablest representatives of both orders.

2. *External History*.—We have said that the military successes of Rome during this period of internal strife were great; but we can only briefly allude to them. The irruption of the Gauls into sub-Appennine Italy (391 B.C.), though accompanied by frightful devastations, was barren of results, and did not materially affect the progress of Roman conquest. No doubt the battle on the Allia, and the capture and burning of Rome (390 B.C.), were great disasters, but the injury was temporary. The vigilance of Manlius saved the capitol, and the heroism of Camillus revived the courage and spirit of the citizens. Again and again in the course of the 4th c. B.C., the Gallic hordes repeated their incursions into central Italy, but never again returned victorious. In 367 B.C. Camillus defeated them at Alba; in 360 B.C. they were routed at the Colline gate; in 358 B.C. by the dictator, G. Sulpicius Peticus; and in 350 B.C. by Lucius Furius Camillus. Meanwhile, aided by their allies, the Latins and the Hernicans, the Romans carried on the long and desperate struggle with the Æquians, Volscians, and Etruscans. Finally, but not till after they had sustained repeated defeats, the Romans triumphed. The causes that led to the decline of the Etruscan power, which, at the close of the regal period in Rome, and during the infancy of the republic, had been enormous, both by sea and land, cannot be considered at length here. Suffice it to say that the terrible irruption of the Gallic barbarians into Etruria, and the victories of the Samnites in Campania, where also the Etruscans had established themselves, as well as the miserable jealousies of the different cities, combined to paralyze the power of this people, and paved the way for the final triumph of Rome. But even before the Gauls had crossed the Appennines, the fate of Etruria was virtually sealed. The fall of Veii (q.v.), 396 B.C., was really the death knell of Etruscan independence. Although the story has undoubtedly descended to us in a mythical dress, the siege of Veii is by no means to be placed in the same category with the siege of Troy, albeit, like it, it is said to have lasted ten years. Falerii, Capena, and Volsinii—all sovereign cities of Etruria—hastened soon after to make peace, and by the middle of the 4th c. B.C., the whole of southern Etruria

had submitted to the supremacy of Rome, was kept in check by Roman garrisons, and denationalized by the influx of Roman colonists. In the land of the Volsci, likewise, a series of Roman fortresses were erected to overawe the native inhabitants; Velitrae, on the borders of Latium, as far back as 492 B.C., Suessa Pometia (442 B.C.), Circeii (393 B.C.), Satricium (385 B.C.), and Setia (382 B.C.); besides the whole Volscian district, known as the Pontine Marshes (q.v.), was distributed into farm allotments among the plebeian soldiery. Becoming alarmed, however, at the increasing power of Rome, the Latins and Hernicans withdrew from the league, and a severe and protracted struggle took place between them and their former ally. Nearly 30 years elapsed before the Romans succeeded in crushing the malcontents and restoring the league of Spurius Cassius. In the course of this war the old Latin confederacy of the "thirty cities" was broken up (384 B.C.), probably as being dangerous to the hegemony (now rapidly becoming a supremacy) of Rome, and their constitutions were more and more assimilated to the Roman. The terms of the treaty made by the Romans (348 B.C.) with the Carthaginians show how very dependent was the position of the Latin cities. Meanwhile, the Romans had pushed their garrisons as far south as the Liris, the northern boundary of Campania. Here they came into contact with the Samnites (q.v.), a people as heroic as themselves, their equals in everything but unity of political organization; perhaps their superiors in magnanimity.

The Samnites had long been extending their conquests in the south of Italy, just as Rome had in the center and in Etruria. Descending from their native mountains between the plains of Apulia and Campania, they had overrun the lower part of the peninsula, and under the name of Lucanians, Bruttians, etc., had firmly established themselves, threatening everywhere the prosperity of the Greek and Etruscan possessions in those regions. But it was the dwellers in the original mountain territory who properly bore the name of Samnites, and between them and the Romans now commenced a tremendous struggle; the former fighting heroically for the preservation of their national freedom—the latter warring with superb valor for dominion. We cannot afford space to recount the circumstances that brought about the collision, further than to state that the Samnite colonies had in the course of time become so detached in sympathy, and so changed in character and interests from the parent stock, as almost to forget their original unity. Hence, hostilities were common between them; and the forays of the Samnite highlanders in the rich lowlands of Campania were dreaded above all things by their more polished, but degenerate, kinsmen of Capua, who had acquired the luxurious habits of the Greeks and Etruscans. It was really to save themselves from these destructive forays that the Campanians offered to place themselves under the supremacy of Rome; and thus Romans and Samnites were thrown into a position of direct antagonism. The Samnite wars, of which three are reckoned, extended over 53 years (343–290 B.C.). The second, generally known as the "great Samnite war," lasted 22 years (326–304 B.C.). At first the success was mainly on the side of the Samnites; and after the disaster at the *Caudine Forks* (q.v.), it seemed as if Samnium, and not Rome, was destined to become the ruler of Italy; but the military genius of the Roman consul, Quintus Fabius Rullianus (see FABIUS), triumphed over every danger, and rendered all the heroism of Caius Pontius, the Samnite leader, unavailing. In 304 B.C. Bovianum, the capital of Samnium, was stormed, and the hardy highlanders were compelled to acknowledge the supremacy of the republic. The third war (298–290 B.C.) was conducted with all the sanguinary energy of despair; but though the Etruscans and Umbrians now joined the Samnites against the Romans, their help came too late. The victory of Rullianus and of P. Decius Mus, at Sentinum (295 B.C.), virtually ended the struggle, and placed the whole of the Italian peninsula at the mercy of the victor. It only remains to be mentioned here that at the close of the first Samnite war, which was quite indecisive, an insurrection burst out among the Latins and Volscians, and spread over the whole territory of these two nations; but the defeat inflicted on the insurgents at Trifanum (340 B.C.) by the Roman consul, Titus Manlius Improbosus Torquatus, almost instantly crushed it, and in two years the last spark of rebellion was extinguished. The famous Latin league was now dissolved; many of the towns lost their independence and became Roman *municipia*; new colonies were planted both on the coast and in the interior of the Latino-Volscian region; and finally so numerous were the farm allotments to Roman burgesses that two additional tribes had to be constituted.

From the Close of the Samnite to the Commencement of the Punic Wars.—The war with Pyrrhus (q.v.), king of Epirus, which led to the complete subjugation of peninsular Italy, is a sort of pendant to the great Samnite struggle. It was brought about in this way: The Lucanians and Bruttians, who had aided the Romans in the Samnite wars, considering themselves cheated of their portion of the spoil, entered into negotiations with the enemies of their former associate throughout the peninsula. A mighty coalition was immediately formed against Rome, consisting of Etruscans, Umbrians, and Gauls in the n., and of Lucanians, Bruttians, and Samnites in the s., with a sort of tacit understanding on the part of the Tarentines that they would render assistance by and by. The rapidity with which it took shape shows alike the fear and the hatred inspired by the Roman name. In the course of a single year the whole n. was in arms, and once more the power, and even the existence of Rome, were in deadly peril. An entire Roman

army of 13,000 men was annihilated at Arretium (284 B.C.) by the Senonian Gauls, but that dauntless spirit which the republic never failed to display in the crisis of its fortunes, and which gave a sublime dignity to its worst ambition, now shone out in the fullness of its splendor. Publius Cornelius Dollabella marched into the country of the Senones at the head of a large force, and literally extirpated the whole nation, which henceforth disappears from history. Shortly afterward the bloody overthrow of the Etrusco-Boian horde at lake Vadimo (283 B.C.), shattered to pieces the northern confederacy, and left the Romans free to deal with their adversaries in the south. The Lucanians were quickly overpowered (282 B.C.); Samnium, broken by its long and luckless struggle, and overawed by the proximity of a Roman army, could do nothing. A rash and unprovoked attack on a small Roman fleet now brought down on the Tarentines the vengeance of Rome, at the very moment Rome was free to exert all her terrible power. Awaking to a sense of their danger the Tarentines invited Pyrrhus (q.v.) over from Epirus, and appointed him commander of their mercenaries. This royal adventurer, a man of the most brilliant, but also of the most volatile genius, resembling no modern general so much as Charles Mordaunt, earl of Peterborough, arrived in Italy (280 B.C.) with a small army of his own, and a vague notion in his head of founding a Hellenic empire in the w., that should rival that created in the e. by his kinsman, Alexander the great. It is not necessary to narrate here the varying fortunes of the struggle between Pyrrhus and the Romans, which lasted only six years, and ended in his being obliged to return to Epirus without accomplishing anything.

After Pyrrhus, baffled in his attempts to check the progress of Rome, had withdrawn to Greece, the Lucanians and Samnites, whom his reputation and original successes had induced to rise once more against the dreaded foe, continued the unequal struggle, but "even the bravery of despair," as it has been said, "comes to an end; the sword and the gibbet at length (269 B.C.) carried peace even into the mountains of Samnium." Tarentum had surrendered three years earlier; and now from the Macra and the Rubicon to the straits of Messina there was not a nation in Italy that did not acknowledge the supremacy of Rome. Distant kingdoms began to feel that a new power had risen in the world; and when Ptolemy Philadelphus, sovereign of Egypt, heard of the overthrow of the famous Epirote warrior, he sent an embassy to Rome (273 B.C.), and concluded a treaty with the republic. To secure their new acquisitions, the Romans established in the s. military colonies at Pæstum and Cosa, in Lucania (273 B.C.); at Beneventum (268 B.C.), and at Æsernia (263 B.C.), to overawe the Samnites; and in the n. as outposts against the Gauls, Ariminum (268 B.C.), Firmum in Picenum (264 B.C.), and the burgess colony of Castrum Novum. Preparations were also made to carry the great Apian highway as far as Brundisium, on the Adriatic, and for the colonization of the latter city as a rival emporium to Tarentum.

The political changes were almost as important as the military. The whole population of peninsular Italy was divided into three classes—1. *Cives Romani*, or such as enjoyed the full burgess privileges of Roman citizens; 2. *Nomen Latinum*—that is, such as possessed the same privileges as had been enjoyed by the members of the quondam Latin league—viz., an equality with the Roman burgesses in matters of trade and inheritance, the privilege of self-government, but no participation in the Roman franchise, and consequently no power to modify the foreign policy of the state; 3. *Soeti*, or "allies," to some of whom were conceded most liberal privileges, while others were governed in an almost despotic fashion. The *Cives Romani* no longer embraced merely the inhabitants of the old Roman community, the well-known "tribes" of whom there are now 33, but all the old burgess-colonies planted in Etruria and Campania, besides such Sabine, Volscian, and other communities as had been received into the burgess body on account of their proved fidelity in times of trial, together with individual Roman emigrants or families of such, scattered among the *municipia*, or living in villages by themselves. The cities possessing the *Latinum Nomen* included most of the "colonies" sent out by Rome in later times, not only in Italy, but even beyond it; the members of which, if they had previously possessed the Roman franchise, voluntarily surrendered it in lieu of an allotment of land. But any "Latin" burgess who had held a magistracy in his native town, might return to Rome, be enrolled in one of the tribes, and vote like any other citizen. The *Soeti* comprised all the rest of Italy, as the Hellenians, the Lucanians, Bruttians, the Greek cities, etc. All national or cantonal confederacies and alliances among the Italians were broken up, and no means were left unemployed by the victors to prevent their restoration.

The Punic Wars.—The origin of Carthage, and the steps by which she rose to power, are sketched in the article *CARTHAGE*. At the time when she came into collision with Rome she was indisputably the first maritime empire in the world, ruling as absolutely in the central and western Mediterranean seas as Rome in the Italian peninsula. Between the Carthaginians and the Romans there had long existed a nominal alliance—the oldest treaty dating as far back as the 6th c. B.C. But this alliance had never possessed any real significance, and latterly the two nations had come to regard each other with considerable distrust. The incident that occasioned the outbreak was quite trivial, and need not be recorded. Suffice it to say that in 264 B.C. war was formally declared between the two nations, and incomparably the most terrible contest in which Rome was ever engaged began.

We do not propose to follow minutely the course of the famous Punic wars—the details of which are narrated at sufficient length under the heads CARTHAGE, HAMILCAR, HANNIBAL, HASDRUBAL, HIERO, REGULUS, METELLUS, FABIUS, MARCELLUS, SCIPIO, and NUMIDIA, to which we refer the reader, but we may briefly indicate their character and result. The wars with Carthage, like those with Samnium, were three in number. The *first* lasted 23 years (B.C. 264–241), and was waged mainly for the possession of Sicily. Its leading feature was the creation of a Roman navy, which, after repeated and tremendous misfortune, finally wrested from Carthage the sovereignty of the seas. Rome, indeed, had never been a merely agricultural state, as may be inferred from a variety of particulars—e.g., the antiquity of the galley in the city arms, of the port-dues on the exports and imports of Ostia, and of commercial treaties with transmarine states—but events had hindered it from engaging to any large extent in maritime enterprise; and its shipping, or at least its fleet, was still quite insignificant, although it had become master of nearly all the Italian seaboard. The necessity for a navy now began to show itself. Not only was there a difficulty felt in transporting troops to Sicily, but the shores of the main-land were completely exposed to the ravages of Carthaginian squadrons. So energetically did the senate set to work, that (we are told) in sixty days from the time the trees were felled, 120 ships were launched, and soon after the consul Caius Duilius gained a brilliant success (260 B.C.) over the Carthaginians off the Mylae, on the north-east coast of Sicily. The exultation of the Romans knew no bounds; and the “triumph” which Duilius received on his return to the city had more the aspect of a carnival than of a noble ceremony. The *Columna Rostrata* (“Beaked Column”) in the forum preserved for ages the memory of the “glorious victory.” Subsequent events, however, were less favorable. An invasion of Africa by Regulus (q.v.) ended in disaster, and the war, which was henceforth confined to Sicily, miserably languished. Thrice was the Roman navy annihilated by storms at sea (255 B.C., 253 B.C., and 249 B.C.); and in spite of a series of unimportant successes by land, the Romans long found it impossible to make any impression on the great Carthaginian strongholds of Lilybæum and Drepanum, mainly on account of the brilliant strategy with which they were held in check by Hamilcar Barca, the father of Hannibal. At last, however, a great sea-fight took place off the Ægates isles (242 B.C.), in which a Roman fleet, commanded by the consul Lutatius Catulus, obtained a magnificent victory. The Carthaginian government, whose treasury was empty, and who had in vain tried to raise a state-loan in Egypt, could—for the present—continue the struggle no longer, and the whole of Sicily, except the territory of Hiero of Syracuse, who had been a firm ally of the Romans, passed into the hands of the victors, who constituted it a Roman province, and placed it under the government of a prætor.—A lapse of 23 years occurred before the second Punic war began, but during that interval neither Romans nor Carthaginians had been idle. The former, with worse than “Punic faith,” had bullied their weak and exhausted rival into surrendering Sardinia and Corsica, which, like Sicily, were transformed into a Roman province. In addition, they had carried on a series of Gallic wars in northern Italy (231–222 B.C.), the result of which was the complete humiliation of the barbarian Boii, Insubres, etc., and the extension of Italy to its natural boundary—the Alps. On the eastern coast of the Adriatic also, the Romans made their power felt by the vigor with which they suppressed Illyrian piracy (219 B.C.). Meanwhile, the descent of Hamilcar on the Spanish coast was followed, after some ineffectual opposition on the part of the natives, by the establishment of a new Carthaginian empire, or at least a protectorate, in the west; and thus, almost before the Romans were aware of it, their hated rival had made good her losses again, and was even able to renew the struggle in a more daring fashion than before. How confident the bearing of the Carthaginians had now become may be seen from the fearless spirit in which they accepted the Roman challenge, and entered on the *second* Punic—or (as the Romans called it) the *Hannibalic*—war, the grand events of which were the crossing of the Alps by Hannibal, the terrible disasters of the Romans at lake Trasimene (q.v.) and Cannæ (q.v.), and the final overthrow of Hannibal at Zama (q.v.), 202 B.C., by Scipio, which once more compelled the Carthaginians to sue for peace. It was with Carthage as with Samnium. The *second* war virtually sealed her fate, and the *third* displayed only the frantic heroism of despair. Her Spanish possessions, like her Sicilian, passed to the Romans (who formed out of them the provinces of *Hispania Citerior* and *Hispania Ulterior*); so did her protectorate over the Numidian sheiks. She was forced to surrender her whole navy (excepting ten triremes), and all her elephants, and to solemnly swear never to make war either in Africa or abroad, except with the consent of her vanquisher. In a word, the imperial supremacy of Rome was now as unconditional in the western Mediterranean as on the main-land of Italy. Her relations, indeed, to the conquered Italian nationalities became much harsher than they had formerly been, for, after the first victories of Hannibal, these had risen against her. The Picentes, Brutii, Apulians, and Samnites were deprived either of the whole or the greater part of their lands—some communities were actually turned into serfs—the Greek cities in lower Italy, most of which had also sided with Hannibal, became the seats of burgess-colonies. But the loss of life and of vital prosperity was frightful. “Numbers of flourishing townships,” says Mommsen, “400 it was reckoned, were destroyed and ruined.” Slaves and desperadoes associated themselves in robber-bands, of the dangers of which an idea may be formed from the fact that in a

single year (185 B.C.) 7,000 men had to be condemned for robbery in Apulia alone; the extension of the pastures with their half-savage slave-herdsmen favored this mischievous barbarizing of the land. But the exultation of victory closed the eyes and the ears of the Romans against every omen, and the perilous work of conquest and subjugation went on. During 201–193 B.C., the Celts in the valley of the Po, who, with the fiery unwisdom of their race, had recommenced hostilities at the very moment Rome was freed from her embarrassments, were thoroughly subjugated; their territory was Latinized, but they themselves were declared incapable of ever acquiring Roman citizenship; and so rapidly did their nationality dissolve that when Polybius, only 30 years later, visited the country, nearly all traces of Celtic characteristics had disappeared. The Boii were finally extirpated about 193 B.C.; the Ligurians were subdued 180–177 B.C.; and the interior of Corsica and Sardinia about the same time. The wars in Spain were troublesome and of longer duration, but they were not at all serious. The natives were indeed perpetually in arms, and the Romans suffered frequent defeats from their sudden and impetuous insurrections; but in the end the superior discipline of the legions always prevailed, and the fiery and chivalrous tribes had of course to make ignominious submission. So little reliance, however, could be placed on these forced submissions, that the Romans felt it necessary to hold Spain by military occupation, and hence arose the first Roman standing armies. Forty thousand troops were maintained in the Spanish peninsula year after year. The most distinguished successes were those achieved by Scipio himself, by Quintus Mucius (197–196 B.C.), by Marcus Cato (195 B.C.), by Lucius Æmilius Paullus (189 B.C.), by Caius Calpurnius (185 B.C.), by Quintus Fulvius Flaccus (181 B.C.), and by Tiberius Gracchus (179–178 B.C.).

Macedonian and Greek Wars.—The causes that led to the interference of Rome in the politics of the east are too complicated to be given here, but the *Macedonian wars* were owing immediately to the alliance formed by Philip V. of Macedon with Hannibal after the battle of Cannæ. Like the Samnite and Punic, the Macedonian wars were three in number. The *first* (214–205 B.C.) was barren of results, mainly because the whole energies of Rome were directed to Spain and lower Italy; but the *second* (200–197 B.C.), though it lasted only a third of the time occupied by the first, taught Philip that another and not he must rule in Greece. The battle of *Cynoscephalæ* ("Dogs' Heads" Hills, a range in Thessaly) was followed by a treaty which compelled him to withdraw his garrisons from the Greek cities, to surrender his fleet, and to pay 1000 talents toward the expenses of the war. Philip was thoroughly quelled, and during the remaining 18 years of his life, he adhered (like old Hiero of Syracuse, though less sincerely) to his Roman alliance. But the miserable Ætoliars, who had formed an alliance with Rome against Philip, with even more stupidity than insolence, quarreled in wanton jealousy with their powerful "friends," and persuaded Antiochus (q.v.) of Syria to come over seas to Thessaly, and fight them. A similar fate befell him to what had befallen Philip. After a war of three years he found himself obliged to surrender all his possessions in Europe and Asia Minor, all his elephants and ships, and to pay 15,000 Euboic talents (£3,660,000) within 12 years. Next year the Ætoliars were crushed, and a little later the despicable quarrels between the Achæians and Spartans led to a general Roman protectorate over the whole of Greece.

Philip of Macedon dying (179 B.C.), was succeeded on the throne by his eldest son Perseus (q.v.) who resolved once more to try the fortune of war with the Romans; and in 172 B.C., the *third and last* Macedonian war began, the result of which, after four years of fighting, was the utter destruction of the Macedonian army at Pydna (168 B.C.) by the Roman consul Lucius Æmilius Paullus (q.v.), the capture of the king, who adorned the triumph of the conqueror, and the dismemberment of the Macedonian empire, which was broken up into four oligarchic republics, the members of which were subjected to severe disqualifications; while in Greece itself, trials and executions for implication in the war of Perseus spread terror everywhere; the conspicuous "patriots"—i.e., all who had made themselves notorious by their anti-Roman and Macedonian policy—were deported to Italy; further, the imperial republic stopped Antiochus Epiphanes in his career of Egyptian conquest, ordered him instantly to abandon his acquisitions, and accepted the protectorate of Egypt, which the grateful and frightened monarch offered her (168 B.C.). Even the allies of Rome—the Pergamene, the Rhodians, etc.—were treated with shocking harshness and injustice. We may here, for the sake of connection, anticipate the course of history, and mention the last *Greek* and *Punic* wars. Both of these came to an end in the same year (146 B.C.). The former was caused by an expiring outburst of pseudo-patriotism in the Achaian league, consequent on the return of the exiles from Rome, and was virtually closed on the siege and destruction of Corinth (q.v.) by the consul Mummius. The latter was not so much a war as a bloody sacrifice to the genius of Roman ambition. After Hannibal's death his party in Carthage seems to have recovered the ascendancy, and as coincident therewith, the commercial prosperity of the city began to revive, a bolder front was shown in resisting the encroachments of Masinissa, the Numidian ruler, whom the Roman senate protected and encouraged in his aggressions. This was enough. Fierce old Cato only expressed the instinctive sentiment of the Roman burghesses, when he came to utter incessantly *Delenda est Carthago*, and in 149 B.C. the senate adopted his barbarous conviction. After a siege of three years, in which the inhabitants displayed superhuman energy and heroism,

Carthage was stormed by Scipio Africanus Minor, and the Carthaginian empire vanished forever from the earth.

Position of Rome at the close of the Punic Wars, and sketch of its subsequent Social Condition to the termination of the Republic.—"Polybius dates from the battle of Pydna the full establishment of the universal empire of Rome. It was in fact the last battle in which a civilized state confronted Rome in the field on a footing of equality with her as a great power: all subsequent struggles were rebellions or wars with peoples beyond the pale of the Romano-Greek civilization—the barbarians, as they were called. The whole civilized world thenceforth recognized in the Roman senate the supreme tribunal, whose commissioners decided in the last resort between kings and nations; and, to acquire its language and manners, foreign princes and noble youths resided in Rome." But contemporaneous with this enormous extension of power and authority in foreign lands, the national character underwent a complete and fatal alteration. The simplicity and stern integrity of life, the religious gravity of deportment, and the fidelity with which common civic and household duties were discharged—well expressed in the saying of Cato, that it was "better to be a good husband than a great senator"—which in early times nobly distinguished the Roman burgess, had now all but disappeared. Those hardy virtues—frugality, temperance, justice, and rectitude—which, combined with courage and energy, had given the strength to the nation that made it great, required for their permanence the social conditions out of which they sprang. But the class of peasant proprietors who had laid the foundations of Roman greatness were either extinct or no longer what they once had been. The original causes of their social degradation have been already noticed, and here it is only necessary to say that the victories of Rome abroad furthered rather than retarded that degradation. The long and distant wars made it more and more impossible for the soldier to be a good citizen or a successful farmer. The freedom and licentiousness of camp-life, the sweets of pillage and rapine, ever grew more pleasant to the Italian burgess and colonist; thus indolence, inaptitude, and spendthrift habits aided the greedy designs of the capitalists, and in most cases the paternal acres gradually slipped into the possession of the great landlords, who found it more profitable to turn them into pasture or cultivate them by gangs of slaves. The rise of the slave-system—though an inevitable result of foreign conquest—was, indeed, the most horrible curse that ever fell on ancient Rome, and the atrocities inflicted on its unhappy victims are far beyond the possibility of description; Moomsen does not exaggerate when he considers it probable that "compared with the sufferings of the Roman slaves the sum of all negro suffering is but a drop." If the Italian farmer honorably strove to retain his small farm he was exposed to the competition of the capitalists, who shipped immense quantities of corn from Egypt and other granaries, where slave-labor rendered its production cheap, and of course he failed in the unequal struggle. Not less pernicious was the change that passed over the character of the rich. We have already shown how the old Roman patricians lost their exclusive privileges, how the plebeians gradually acquired a full equality with them, and how the germs of a new social aristocracy originated, based on wealth rather than pedigree, and comprising both plebeians and patricians. During the 4th and 3d centuries b.c. the political power of this order immensely increased. In fact the whole government of the state passed into their hands. They became an oligarchy, and while it is not to be denied that they displayed extraordinary ability in the conduct of foreign affairs, the vices inseparable from oligarchic rule—selfishness, nepotism, and arrogance, of which Scipio is a striking example—gradually became rampant. Regarding themselves as the Roman community *par excellence* and the poor burgesses as a mere *canaille*, whose wishes and interests were unworthy of a moment's consideration, they virtually relapsed into the exclusiveness of the ancient *populus* with this difference for the worse, that their wealth, influence, and pride were a thousandfold greater than those of Coriolanus or Camillus. But far worse than even the nepotism and selfishness of the nobles was their ever-increasing luxury and immorality. When Rome had conquered Greece, and Syria, and Asia Minor, the days of her true greatness were ended. The wealth that poured into the state coffers, thence to be (really if not formally) distributed among the clique of nobles, the treasures which victorious generals acquired, enabled them to gratify to the full the morbid appetites for pleasure engendered by exposure to the voluptuousness of the east. Such results were, it is true, not brought about in a day, nor without a resolute protest on the part of individual Romans. The attitude of Cato Major toward the Hellenizing tendencies of his brother nobles was doubtless patriotic, and posterity has been generous in its laudation of his antique virtue; but Cato Major was nevertheless only a political fanatic and incarnate anachronism. So long as Rome chose to subdue foreign nations and to hold them by the demoralizing tenure of conquest—i.e., as mere *provinces*, whose inhabitants, held in check by a fierce and unscrupulous soldiery (like the Kabyles of Algeria by the French, or, until recently, the Hindus by the British), neither possessed political privileges nor dared cherish the hope of them—it was morally impossible for the citizens, either at home or abroad, to resume the simple and frugal habits of their forefathers. After Cato's time things grew worse instead of better, nor from this period down to the final dissolution of the empire was a single *radical* reform ever permanently effected. The momentary success of Tiberius and of his far abler brother, Caius Gracchus (q.v.), in their desperate and revolutionary attempts to prevent the social ruin of the state by

breaking down the powers of the senate, redistributing the domain lands, reorganizing the administration, and partially restoring the legislative authority of the popular assemblies, hardly survived their death; and the reaction that ensued proved that the senate, like the Bourbons, could learn nothing from adversity, and that the rabble of the city were incapable of elevation or generosity of political sentiment. Henceforth the malversation of the public money by prætors and quæstors became chronic, and the moral debauchery of the mob of the capital by the largesses of ambitious politicians and the vile flattery of demagogues, complete. The old Roman faith, so deep, and strong, and stern, disappeared from the heart. The priests became Pharisees, the nobles "philosophers" (i.e., unbelievers), their wives practitioners of oriental abominations under the name of "mysteries;" while the poor looked on with unmeaning, yet superstitious wonder at the hollow but pompous ceremonies of religion. It would serve no useful purpose to dwell longer on these aspects of Roman society, and we now turn to sketch in a few words the course of outward events to the close of the republic.

From the Destruction of Carthage to the Termination of the Republic.—We have already alluded to the wars waged in Spain during the first half of the 2d c. B.C. The humane and conciliatory policy pursued toward the natives by Tiberius Sempronius Gracchus, father of the ill-fated tribunes, brought about a peace, 179 B.C., that lasted 25 years; but in 153 B.C., a general rising of the Celtiberians took place, followed by another on the part of the Lusitanians of Portugal. The struggle maintained by these gallant barbarians against their mighty oppressor, lasted, with intervals of peace, for the space of 20 years, but ended, in spite of gleams of brilliant success, as such contests invariably do, in the final overthrow of the undisciplined and uncivilized combatant. All the valor of the shepherd-warrior Viriathus (q.v.), even if the assassin's steel had spared his life, would not have prevented the annexation of Lusitania to the Roman empire, nor did the unsurpassable heroism of the besieged Numantines avail to baffle the military skill of the younger Scipio.

Toward the conclusion of the Numantine war occurred the first of those horrible social outbreaks known as "servile" or "slave" wars, which marked the later ages of the republic. The condition of the slaves has been already referred to; but what aggravated the wretchedness of their lot was the fact that most of them had been originally freemen—not inferior in knowledge, skill, or accomplishments to their masters, but only in force of character and military prowess. The first slave insurrection broke out in Sicily, 134 B.C., where the system was seen at its worst. Its leader was one Eunus, a Syrian, who, mimicking his native monarch, took the title of king Antiochus. The suddenness and barbaric fury of the revolt for a time rendered all opposition impossible. The slaves overran the island, like demoniaes let loose; and routed one Roman army after another. But a slave insurrection has no aim beyond immediate revenge, and when the first wild paroxysms of ferocity are over, it becomes powerless, more even from a moral than a physical exhaustion, and can be quelled with ease. In 132 B.C. the consul Publius Rupilius restored "order" in the island. In the east, fortune continued to smile upon the Roman arms. Attalus III., Philometer, a villainous despot of the true oriental stamp, who massacred or poisoned every one that ventured to give him advice, dying 133 B.C., bequeathed his client-kingdom of Pergamus to its protector—Rome; and after a fierce struggle with an ambitious pretender called Aristonicus, the Romans obtained possession of the splendid bequest, and formed it into the province of Asia, 129 B.C.

We may here enumerate the different provinces into which the Roman senate divided its foreign conquests in the order of their organization. 1. Sicily, 241 B.C.; 2. Sardinia and Corsica, 238 B.C.; 3. Hispania Citerior, and 4. Hispania Ulterior, 205 B.C.; 5. Gallia Cisalpina, 191 B.C.; 6. Macedonia, 146 B.C.; 7. Illyricum, *circa* 146 B.C.; 8. Achaia (or Southern Greece), *circa* 146 B.C.; 9. Africa (i.e. the Carthaginian territory), 146 B.C.; 10. Asia (kingdom of Pergamus), 129 B.C. A few years later, 118 B.C., an 11th was added by the conquest of the southern part of transalpine Gaul, and was commonly called, to distinguish it from the rest of the country, "the Province;" hence the modern *Provence*.

In Africa, the overthrow of Jugurtha (q.v.), 104 B.C. by the consul Marius, added yet further to the military renown and strength of the republic. Meanwhile, from a new quarter of the world, a gigantic and unforeseen danger threatened the Roman state. North of the Alps there had long been roaming in the region of the middle Danube an unsettled people called the Cimbri (q.v.), whose original home was probably the n.w. of Germany. They first came into collision with the Romans in Noricum, 113 B.C.; after which they turned westward, and poured through the Helvetic valleys into Gaul, where they overwhelmed alike the native tribes and the Roman armies. At Arausio (Orange) on the Rhone, 105 B.C., a Roman army of 80,000 was annihilated; but instead of invading Italy, the barbarians blindly rushed through the passes of the Pyrenees, wasted precious months in contests with native tribes of Spain as valiant and hardy as themselves, and gave the Romans time to recover from the effects of their terrible defeat. Marius, who had just returned from his Numidian victories, was reappointed consul; and at Aqua-Sextie (Aix, in Dauphiné), he literally exterminated the dreaded foe, 102 B.C. Next year, near Milan, the same doom befell another northern horde—the Teutones, who had accompanied the Cimbri in their irruption into Spain; but on their withdrawal, had parted from their associates in Gaul, forced their way back through Switzerland,

and descended into Italy by the Tyrolese valleys. In the same year a second insurrection of the slaves in Sicily, which had reached an alarming height, was suppressed by the consul Marcus Aquilius.

For the next 10 years the internal history of Rome is a scene of wild confusion and discord. Marius, an admirable soldier, but otherwise a man of unequal talents, and utterly unfit to play the part of a statesman, was the idol of the poor citizens, who urged him to save the state from the rapacious misgovernment of the rich. His attempts were pitiable failures; the brave honest soldier fell into the hands of unscrupulous demagogues like Glaucia and Saturninus, and sullied the laurels he had won in war by associating with men who did not hesitate to assassinate a political opponent. Not less fruitless was the wise and patriotic effort of Livius Drusus—"the Gracchus of the aristocracy"—to effect a compromise between the privileges of the rich and the claims of the poor. The oligarchic party among the former, i.e. the senate, were enraged by his proposition to double their numbers by the introduction of 300 equites; the latter by his offer to the "Latins" and "allied Italians" of the Roman franchise. Drusus fell 91 B.C., by the steel of a hired bravo. Hardly a year elapsed before the whole of the subject "Italians"—i.e., the Marsians, Pelignians, Marrucini, Vestinians, Picentines, Samnites, Apulians, and Lucanians—were up in wild and furious revolt against Rome; and, though the rebellion was crushed in less than two years by the superior generalship of Marius, Sulla, and Pompeius Strabo (father of the "great" Pompey), the insurgents virtually triumphed; for the promise which Drusus had held out to them of the "Roman franchise," was made good by the *Lex Plautia Papiria*, 89 B.C. Yet the cost was terrible. It is calculated that 300,000 men—the flower of Rome and Italy—perished in the struggle; nor was even this tremendous holocaust sufficient to appease the fates. The jealousy that had long existed on the part of Marius toward his younger and more gifted rival, Sulla (q.v.), kindled into a flame of hate when the latter was elected consul 88 B.C., and received the command of the Mithridatic war—an honor which Marius coveted for himself. Then followed the fearful years of the "civil wars" between the two chiefs, 88–82 B.C., when blood was spilt like water; and proscriptions and massacres were the order of the day. It was a "reign of terror"—surpassing even the excesses of the French revolutionists. Sulla, the leader of the aristocracy, which was nominally the party of order, triumphed, but the ferocious energy displayed by the revolutionists convinced him that the "Roman franchise" could never again be safely withdrawn from the "Italians;" and Roman citizens, therefore, they remained till the dissolution of the empire; but, on the other hand, his whole legislation was directed toward the destruction of the political power of the burgesses, and to the restoration to the senatorial aristocracy and priesthood of the authority and influence they had possessed in the times of the Punic wars. That his design was to build up a strong and vigorous executive cannot admit of doubt, but the rottenness of Roman society was beyond the reach of cure by any human policy. It would be hopeless in our limits to attempt even the most superficial sketch of the complicated history of this period, which, besides, will be found given with considerable fullness of detail in the biographies of its leading personages. SERTORIUS, LUCULLUS, CRASSUS, POMPEY, MITHRIDATES, CÆSAR, CICERO, CATILINE, MARK ANTONY, LEPIDUS, CLEOPATRA, CLODIUS, BRUTUS, CASSIUS, CATO, and AUGUSTUS. The very utmost we can attempt is to enumerate results.

Abroad the Roman army continued as before to prove irresistible. About 13 years after the extermination of the northern barbarians, the Cimbri and Teutones, or in 88 B.C., broke out in the far east the first of the "Mithridatic wars," which, like the Samnite, Punic, and Macedonian wars, were three in number. Begun by Sulla, 88 B.C., they were brought to a successful close by Pompey, 65 B.C., although the gen. that had really broken the power of Mithridates was Lucullus. The result was the annexation of the sultanate of Pontus, as a new province of the Roman republic. Next year, Pompey marched southward with his army, deposed Antiochus Asiaticus, king of Syria, and transformed his kingdom also into a Roman province, while in the following year (63 B.C.) he reduced to a state of dependence Phenicia, Cœle-Syria, and Palestine, storming Jerusalem, and, to the horror of the Jews, violating their holy of holies. But what a terrible commentary it is upon these glittering triumphs to remember that during the same year there was hatched at Rome the conspiracy of Catiline (q.v.), which, if it had not been crushed by an extraordinary display of decision on the part of the consul Cicero, would have placed at least the city of Rome at the mercy of a crew of aristocratic desperadoes and cut-throats. One thing now becomes particularly noticeable, viz., the paralysis of the senate—that "governing board" as Mommsen calls it, that had once been the mightiest power in the world. In spite of all that Sulla did to make it once more the governing body in the state, the power passed out of its hands. Torn by wretched jealousies, spites, piques (personal and partisan), it could do nothing but squabble or feebly attempt to frustrate the purpose of men whom it considered formidable. Henceforth the interest as well as the importance of Roman history attaches to individuals, and the senate sinks deeper and deeper into insignificance, until at last it becomes merely the obsequious council of the emperors. The famous coalition of Crassus, Pompey, and Cæsar (known as the *first triumvirate*), which dates from the year 60 B.C., proves how weak the government and how powerful individuals had become; and the same fact is even more dismally brought out by the lawless and bloody tribunates

of Clodius and Milo (58–57 B.C.), when Rome was for a while at the mercy of bravos and gladiators. The campaigns of Caesar in Gaul (58–50 B.C.), by which the whole of that country was reduced to subjection; his rupture with Pompey; his defiance of the senate; the civil wars; his victory, dictatorship, and assassination; the restoration of the senatorial oligarchy; the second triumvirate, composed of Antony, Lepidus, and Octavian; the overthrow of the oligarchy at Philippi; the struggle between Antony and Octavian; the triumph of the latter, and his investment with absolute power for life (29 B.C.), which put an end at least to the civil dissensions that had raged so long (and was therefore so far a blessing to the state), are described in the biographical articles already referred to.

THE ROMAN EMPIRE.—When Augustus had gathered up into himself all the civil and military powers of the state, its political life was at an end; henceforth the voices of the citizens are dumb, and only the rude clamor of the legions or the prætorians (q.v.) is heard, as emperors rise and fall. It is, indeed, amazing to consider how long brute force managed to keep under the elements of anarchy and dissolution in the empire; but it must be remembered that it was the east that ruined Rome, and not Rome the east. Even in the worst days of the republic, the Roman administrators of the provinces were acknowledged to be less unjust, ravenous, tyrannical, and cruel than the native princes and sultans; and the servile myriads of Asia Minor and Syria witnessed the deposition of their dynasts without a shadow of regret—sometimes even with a cry of joy. The Romans had therefore comparatively little difficulty in retaining and even increasing their eastern conquests, while the superior discipline of their well-trained soldiery enabled them to repel and subdue even the intrepid barbarians of the north, though singly these were probably more gallant men than the rank and file of the imperial legions. But no military prowess, however great, will, beyond a certain time, serve to keep a nation alive that is otherwise moribund; and even Christianity, with all its antiseptic and revivifying influences, came too late to reanimate the national life of the empire. When Augustus died (14 A.D.), the Roman empire was separated in the n. from Germany by the Rhine, but it also included both Holland and Friesland; from about the lake of Constance it ran along the Danube to lower Mœsia, though the imperial authority was far from being firmly established there. In the e., the boundary-line was, in general, the Euphrates; in the s., Egypt, Libya, and, in fact, the whole of northern Africa, as far w. as Morocco, and as far inland as Fezzan and the Sahara, acknowledged Roman authority. The Roman franchise was extended to transmarine communities, and in the western provinces especially it became quite common. To keep this enormous territory,—containing so many different races—quiet an army of 47 legions and as many cohorts was maintained, most of whom were levied among the newly admitted burgesses of the western provinces. The reigns of Tiberius (q.v.), Caligula (q.v.), Claudius (q.v.), Nero (q.v.), Galba (q.v.), Otho (q.v.), and Vitellius (q.v.) present little of any moment in a general survey of the external history of the empire, though the chronicle of their lives—those of Galba and Otho, perhaps, excepted—has all the horrible and revolting interest that attaches to records of conspiracy, assassinations, poisonings, massacres, lust, debauchery, and delirious madness. The most notable incident of this period is probably the concentration of the prætorian guards in the vicinity of Rome during the reign of Tiberius, which Niebuhr even pronounces “the most momentous event in the history of the emperors;” and not without reason, for, until their dissolution by Diocletian, they were the real sovereigns of the empire. In Nero’s time, Armenia was wrested from the Parthians, and only restored to them on condition of their holding it as a “fief” of the empire; the Roman authority in England was likewise extended as far n. as the Trent; and a great rebellion in Gaul (not, however, against Rome, but only against Nero), headed by Julius Vindex, a noble Aquitanian and a Roman senator, was crushed by T. Virginius Rufus, the commander of the Germanic legions. During the profound peace that the empire had enjoyed everywhere, except on its frontiers—since the usurpation of the imperial authority—its material prosperity had greatly increased. The population was more than doubled; the towns became filled with inhabitants, and the wastes were peopled, wherever, at least, the publicani (q.v.) or farmers-generals had not got the land into their rapacious hands; but the immorality of the rich, especially among the females, became yet worse than before, and virtuous men actually preferred concubinage with a slave, to marriage with a free-born Roman lady.

With the accession of Vespasian (q.v.) a better era commenced, which, if we except the reign of Domitian, continued uninterrupted for a space of 100 years, comprising the reigns, besides those mentioned, of Titus (q.v.), Nerva (q.v.), Trajan (q.v.), Hadrian (q.v.), Antoninus Pius (q.v.), and Marcus Aurelius (q.v.). These were all men of fine and honorable character—some, as e.g., Trajan, Hadrian, and Marcus Aurelius, were really illustrious rulers, worthy of the best days of Rome. Under all of them the provinces were better governed, the finances better administered, and public morals wonderfully improved. Nothing, indeed, is more clear than that, after the time of Vespasian, that *restaurator rei publicæ*, as he has been justly called, the worst days of Rome (in a moral point of view) were over. Never again did she give way to the horrible sensuality, gluttony, and profligacy of the 1st century. Bad emperors she had as well as good, but they did not again succeed in corrupting their age. Blood, indeed, was

shed freely enough, hostilities on the frontiers were as frequent as ever, and the violence and selfishness of military ambition were things that paganism did not seek, and had not the power, to quell; but the wild abyss of anarchy into which the empire latterly fell is less dreadful than the saturnalia of vice that filled the soul of Juvenal with indignation in the days of Domitian. How far the change was due to the influence of the ever-extending Christian religion it is impossible to tell; but that Christianity did send a reinvigorating breath of new life through the old decaying body of the state is beyond all dispute, and is written on the very face of the history of the first centuries. The chief military events, from the days of Vespasian to those of Marcus Aurelius, are the final conquest of Britain by Agricola (q.v.), the final conquest of the Dacian monarchy, the victorious invasion of Parthia and of northern Arabia; and the conquest of the valley of the Nile as far s. as upper Nubia, by Trajan; the chastisement of the Marcomanni, Quadi, Chatti, etc., by Marcus Aurelius. Hadrian's long rule of 21 years was peaceful, but is memorable as the most splendid era of Roman architecture. The reigns of Commodus (q.v.), Pertinax (q.v.), and Didius Julianus (q.v.) were insignificant, except in so far as they show us the wretched confusion into which the administration of affairs inevitably fell when bad, or hated, or feeble rulers were invested with the purple. Able generals, respectable jurists, honorable senators are not wanting, but their influence is personal and local. The reign of Septimius Severus (193-211 A.D.) is memorable as marking the first real change in the attitude of the emperors toward Christianity. The new religion was beginning to make itself felt in the state; and Severus, who was a Carthaginian, while his wife was a Syrian, may have felt a special interest in a faith that like themselves was of Semitic origin. At all events it was taken under the imperial protection, and began to make rapid way. Caracalla (q.v.) and Elagabalus (q.v.) are perhaps the worst of all the emperors in point of criminality; but the mad brutality of the one and the monstrous debauchery of the other were purely personal affairs, and were regarded with horror by the citizens of the empire. The reign of Alexander Severus is marked by the downfall of the Parthian dynasty of Persian kings, and the rise of the native Sassanide (q.v.), which, as Niebuhr observes, "was one of the unluckiest things that could have happened to the Roman empire," for the latter proved far more formidable enemies than the Parthian rulers. After the assassination of Severus (235 A.D.) followed a period of confusion, bloodshed, and general mismanagement. The names of Maximin (q.v.), Maximus (q.v.), Balbinus (q.v.), Gordianus (q.v.), and Philip (q.v.) recall nothing but wretched quarrels, often ending in assassination. Then followed "the beginning of the end." The whole of Europe beyond the Roman frontier—the mysterious north—began to ferment. The Franks showed themselves on the lower Rhine, the Suabians on the Maine; while the Goths burst through Dacia, routed the forces of Decius (q.v.), and slew the emperor himself at mount Hæmus, crossed the Euxine, and ravaged the whole northern coast of Asia Minor. A little later—during the reigns of Valerian (q.v.), Gallienus, and the so-called *thirty tyrants*—the empire is nothing but a wild distracted chaos, Franks, Alemanni, Goths, and Persians rushing in from their respective quarters, like vultures scenting prey. The Goths swept over the whole of Achaia, pillaging and burning the most famous cities—Athens, Corinth, Argos, etc.; while the Asiatic hordes of Sapor committed even greater havoc in Syria and Asia Minor; and but for the courage and skill of Odenathus, husband of Zenobia (q.v.), who had built up a strong independent kingdom in the Syrian desert, with Palmyra for its capital, might have permanently possessed themselves of the regions which they merely devastated. With Claudius Gothicus (268-270 A.D.), the fortunes of the empire once more begin to brighten. By him, and his successors Aurelian (q.v.), Probus (q.v.), and Carus, the barbarians of the n. and n.w., as well as the Persians in the e. were severely chastised. Nay, when Diocletian obtained the purple (284 A.D.), it seemed as if the worst were over, and the empire might still be rescued from destruction; but his division of the empire into east and west, with separate *Augusti* and assistant *Cæsars*—though it sprang from a clear perception of the impossibility of one man administering successfully the affairs of so vast a state—led to those labyrinthine confusions and civil wars, in which figure the names of Maximian (q.v.), Constantius (see CONSTANTINE), Galerius (q.v.), Maxentius (q.v.), Maximin (q.v.), Licinius (q.v.), and Constantine, and which were only brought to a close by the surpassing genius of the last-mentioned. Under Constantine (324-337 A.D.), as all the world knows, occurred the greatest revolution in Roman history since the birth of Christ—viz., the establishment of Christianity as the religion of the state. He also transferred the seat of government from Rome to Byzantium on the Bosporus, where he founded a new city, and named it after himself. But no sooner was the great statesman dead than the mutinous discords that he had kept under by the vigor of his rule, broke loose; the empire underwent a triple division among his sons; and though Constantius, the youngest, ere long became sole ruler, he failed to display the genius of his father, and in his repeated campaigns against the Persians reaped nothing but disaster and disgrace. But the political fortunes of the empire now possess only a secondary interest; it is the struggles of the Christian sects and the rise of the Catholic church that mainly attract the attention of the historian. There, at least, we behold the signs of new life—a zeal, enthusiasm, and inward strength of soul that no barbarism could destroy. Christianity came too late to save the ancient civilization, but it enabled the Roman world to endure three centuries of utter barbarism, and

afterward to recover a portion of the inheritance of culture that it once seemed to have lost forever. Julian's attempt to revive paganism was a lamentable anachronism, but his efforts, when governor of Gaul under his kinsman Constantius, to repel the incessant incursions of the Franks and Alemanni, displayed a fine valor and generalship, and were crowned with success. The judgment of the poet Prudentius on the apostate is that of posterity: *Perfidus ille Deo, sed non et perfidus orbi*. But after the death of Julian, the signs of the approaching dissolution of the empire became more unmistakable. Yet the great state was, if we may so speak, loath to die; and again and again in her death agony, she put forth a momentary strength that amazed her foes, and taught them that even the expiring struggles of a giant were to be feared. Valentinian (q.v.), Gratian (q.v.), and Theodosius (q.v.) were rulers worthy of better times. The last-mentioned is even known to history as the "great." But they fought against destiny, and their labor was in vain. Already swarms of ferocious Huns (q.v.) from the east had driven the Goths out of Dacia, where they had long been settled, and forced them to cross the Danube into the Roman territory, where the cruelty and oppression of the imperial officers goaded the refugees into insurrection; and in their fury, they devastated the whole east from the Adriatic to the Euxine. Theodosius indeed subdued and even disarmed them; but he could not prevent them from drawing nearer to the heart of the empire, and already they are found scattered over all Mœsia, Servia, and northern Illyricum. Hardly was Theodosius dead when they rose again, under their chief, Alaric (q.v.), against Honorius, emperor of the west. Rome was saved (for the moment) only by the splendid bravery and skill of Stilicho (q.v.), the imperial gen.; but after his assassination, the barbarians returned, sacked the city (410 A.D.), and ravaged the peninsula. Three years earlier, hordes of Suevi, Burgundians, Alemanni, Vandals, and Alans burst into Gaul (where the native Celts had long been largely Romanized in language and habits), overran the whole, and then penetrated into Spain, where a Vandal empire was rapidly set up. It is utterly impossible (within our limits) to explain the chaotic imbroglio that followed in the west—the struggles between Visigoths and Vandals in Spain, between Romans and both, between usurpers of the purple and loyal generals in Gaul—the fatal rivalries of those otherwise noble and gifted men—Boniface, governor (*comes*) of Africa, and Ætius, governor of Gaul—which led to the invasion of Africa by Genseric (q.v.), and its devastation from the straits of Gibraltar to Carthage (429 A.D.). While such was the state of affairs in the west, things were not a whit better in the east. There the Huns, from mere love of havoc, had reduced vast regions to an utter desert; for nearly 50 years, indeed, the little ferocious demons had rioted in destruction. At last, a trivial quarrel sent them into Gaul; but somewhere in Champagne they were routed with great slaughter (451 A.D.) by a combined force of Visigoths, Burgundians, Franks, and Roman mercenaries, under Ætius and Theodoric, king of the Goths; and in spite of their successful invasion of Italy in the following year, their strength was permanently broken, and henceforth they play an insignificant part in history. But Ætius, the only man who could have decently propped up the wretched ruin called the western empire, was assassinated by his contemptible sovereign Valentinian, whose own outrages led to his murder too; while his widow, Eudoxia, to be revenged on his murderer and successor, Petronius Maximus, invited Genseric, the "scourge of God," over from Africa, and exposed Rome to the horrors of pillage for 14 days. Ricimer, a Sueve, next figures as a sort of governor of the city, and what relics of empire it still possessed, for Gaul, Britain, Spain, western Africa, and the islands in the Mediterranean, had all been wrested from it. While Majorian—the last able emperor—lived, Ricimer's position was a subordinate one, but, thenceforth, the western emperor merely was an emperor in name—a *roi fainéant*—while the real sovereignty was exercised by this Suevic *maire du palais*, who was succeeded in his functions by the Burgundian king Ennobald, and the latter again by Orestes, in whose time the final catastrophe happened, when Odoacer (q.v.), placing himself at the head of the barbarian mercenaries of the empire, overthrew the last, and the most ridiculous occupant of the throne of the Cæsars (476 A.D.), who, by a curious coincidence, bore the same name as the mythical founder of the city—Romulus. See, besides the ancient histories of Polybius, Livy, Sallust, Tacitus, etc., the modern histories of Gibbon, Niebuhr, Arnold, Merivale, Mommsen, and Ihne.

ROME, the capital of ancient Italy, stood on the left bank of the Tiber, about 16 m from the sea. The legend of its origin belongs to Roman history, and is discussed partly under that heading, and partly in the article **ROMULUS**. It was built at first in the form of a square (*Roma Quadrata*), and gradually extended, until, in the reign of Servius Tullius, it embraced one after another the famous seven hills—viz., the Palatine, Capitoline, Quirinal, Cælian, Aventine, Viminal, and Esquiline. Servius Tullius (according to the legend) so extended the *pomærium* as to make the sacred inclosure of the city identical with its walls. After its first destruction in 390 B.C. by the Gauls, it was hastily rebuilt without respect to order, and with narrow irregular streets. At the close of the wars against Carthage, Macedonia, and Syria, public buildings and private houses of great architectural beauty were added; and under Augustus, improvements of a similar kind were made, while the mean and narrow streets were allowed to stand. In

the reign of Nero, 64 A.D., two-thirds of the city were destroyed by fire, a catastrophe which furnished that emperor with the opportunity of gratifying his architectural predilections, in widening and straightening the streets, and in restricting the height of the houses, of which a certain part was built of fireproof stone from Gabii and Alba. Although it had long outgrown the limits prescribed by Servius Tullius, still the walls of that king marked the extent of Rome properly so called down to the 3d c. A.D. Under Aurelian, however, the need of fortifications led to the construction of new walls, which took in the city of Servius Tullius with all the suburbs, such as the *Mons Janiculus* on the right of the Tiber, and the Pincian on the left. These walls, begun 271 A.D., were completed by the next emperor, Probus, were 11 m. in circumference, and were afterward restored by Honorius, and partially rebuilt by Belisarius.

Extent and Population of Rome.—Under Servius Tullius the walls were 7 m. in circumference, but the space which they comprised was not entirely occupied by buildings. Under Aurelian the new walls were 11 m. in circumference, and the city went on extending until it reached a circumference of 13 m. under Vespasian. The population at any given period cannot be exactly determined. According to the *Monumentum Ancyranum*, the *plebs urbana* under Augustus amounted to 320,000; with the addition of women, senators, and knights, the inhabitants must have numbered about 650,000; while the slaves, who cannot have been less numerous than the free population, must have given an aggregate of at least 1,300,000. Considering the enlargement of the city under Vespasian we may safely set its population down at not less than two millions in his reign.

The Walls and Gates.—The first wall, that attributed to Romulus, embraced merely the Palatine, and was pierced by three gates. The larger wall of Servius Tullius does not appear to have been continuous, but only to have connected the seven hills by fortifications drawn across the narrow valleys intervening. According to Pliny there were 37 gates in this wall. Subsequent to the walls of Servius were those of Aurelian, which, with the exception of the part beyond the Tiber, are the same as those which surround the modern city. They were divided by 14 gates. The Tiber was crossed by eight bridges.

In the interior of the city were several open spaces of ground, paved with stones, which were used as places of business or as market-places, and were called *fora* (see FORUM.) Besides these there were other open spaces of much larger extent, which were grass-grown, and set with trees and works of art. Of these, which were called *campi*, and were used by the people in their exercises and amusements, the chief was the Campus Martius. Surrounding these fora and campi were the private and public buildings of Rome, which were arranged in streets and districts. The chief street was the celebrated Via Sacra, remains of which are still to be seen in the Forum of modern Rome.—Rome contained no fewer than 400 temples, the oldest being the temple of the Feretrian Jupiter on the Capitoline, which was built, according to tradition, by Romulus, and restored by Augustus. The most famous in history, and the most magnificent in architecture, was the Capitolium, placed on the summit of the Capitoline (see CAPITOL.) The only other temple requiring special mention was the Pantheon (q.v.), built by Agrippa, 27 B.C. It is still standing.—For other striking features of the ancient city, see CIRCUS, AMPHITHEATER, BATH, BASILICA.

Rome also abounded in covered walks, supported by columns, and open on one side. These were known as *porticus*, and were frequented for the purposes of recreation, or of transaction of business. They were in many cases adorned with paintings and other works of art, and furnished with libraries.—More peculiar to ancient Rome, however, were the triumphal arches. See ARCH, TRIUMPHAL.—The great prison of Rome was the Carcer Mamertinus, built by Ancus Martius on the slope of the Capitoline, which overhangs the Forum. Servius Tullius added to it a subterranean dungeon, 12 ft. underground, walled and arched over with masonry.—In addition to the prisons we may mention the barracks (*castra*), such as the Castra Praetoria, built by the emperor Tiberius for the imperial guards; and the Castra Pergrina, where the foreign troops were quartered; the aqueducts (see AQUEDUCT); and the sewers (see CLOACA MAXIMA).

Rome also abounded in palaces (*palatia*). Of these the Palatium, or imperial palace, fronting the Forum, was so enlarged by Augustus that, from being the private house of Hortensius the orator, it became the imperial residence. Nero built two still more splendid palaces, one which covered the whole Palatine hill and part of the Esquiline, and was burned down in the great fire; and one which replaced the other. Many of the private palaces were also on a magnificent scale.—On the hills around the city were laid out *horti*, or parks and gardens, and were adorned with handsome building and works of art.—Rome was also rich in sepulchral monuments. See ROMAN ARCHITECTURE.—In addition to these imperial or private mausolea, columns were also erected to the more illustrious of the Romans, such as the Columna Rostrata, in honor of the consul C. Duilius for his victory over the Carthaginian fleet; the Columna Trajana, in the Forum; and the Columna Antonini Pii in the Campus Martius.—Obelisks (q.v.), mostly transported from Egypt, occupied prominent parts of the city. Since Rome has again become the capital of Italy extensive excavations among the ruins have been carried on upon a systematic plan, and with interesting results.

Modern Rome occupies the plain on each side of the Tiber and the slopes of the seven

hills. Its geographical position at the observatory of the collegio Romano is lat. $41^{\circ} 53' 52''$ n., long. $12^{\circ} 28' 40''$ e., and its height above the level of the sea on the Tiber under the Ælian bridge is 20 feet. Pop. Dec. 31, 1871, 229,353; that of the commune, 244,484. The members of religious orders in 1867 were 7,400, including 30 cardinals, 35 bishops, 2,832 monks, and 2,215 nuns. It contained 4,650 Jewish residents, still compelled to inhabit a particular quarter, called the Ghetto. 50,000 persons were then in receipt of public alms.

The city is built on marshy ground, and is divided by the Tiber into two very unequal parts, that on the left bank being Roman proper, and that on the right bank being the Leonine city, or Trastevere. Its walls, 12 m. in circuit, and containing 16 gates, of which 4 are built up, inclose a space of which little more than one-third is inhabited, the greater part to the s. of the capitol being cultivated as gardens or vineyards. The site of the ancient Campus Martius constitutes the lower and most densely populated part of the town, in which all the trade is carried on. Its central part is crossed by the Corso, a street about 1 m. long, and running from the Piazza del Popolo, or great northern entrance of Rome, to the Palazzo di Venezia, at the foot of the capitol. From the Piazza del Popolo a handsome open space, with an obelisk from the temple of the sun at Heliopolis in the middle, branch out to the right and left of the Corso, the Piazza di Spagna, the favorite quarter of foreigners, and the Ripetta. More than half-way up the Corso, and to the right, runs the wide street or Strada del Gesù, leading to the noble church and convent of that name, the chief residence of the order of the Jesuits. On either side of the Corso the buildings are regular and substantial, and consist of palaces, such as the Borghese, the Ruspoli, the Ghigi, and others, besides many churches. Between the Corso and the Tiber, to the w., the streets are irregular, densely peopled with inferior tradesmen, and consisting mainly of market-places, shops, and dwellings of a low class. In this quarter is the university La Sapienza, between which and the Corso is the Rotunda or Pantheon. South of Ponte Sisto, on the left bank of the Tiber, and winding round the western base of the capitol to the foot of the Palatine, is the Ghetto, or Jews' quarter, consisting of narrow dirty alleys, with rows of high old houses. Still further s., and on the left bank of the Tiber, runs a series of narrow streets as far as the Palatine, containing some of the oldest churches in Rome, such as the Santa Maria in Cosmedin, built in the 3d century. Beyond this extend to the s.e. the Aventine, Palatine, and Cælian hills, which are covered with gardens, vineyards, and orchards, besides churches, convents, and ruins. At the eastern extremity of the Cælian stands the magnificent basilica of San Giovanni in Laterano. To the s. of the Aventine, and between it, the river, and the walls, are the Prati del Popolo Romano, forming part of a large space of low-lying cultivated ground. Near the Prati lies the Protestant cemetery.

On the slope of the Pincian and Quirinal hills, and covering part of the plateau which joins all the eastern hills of Rome, lies the upper town, consisting mainly of palaces, villas, churches, convents, and other buildings on a large scale. It abounds with ample courts and gardens, and is crossed by two long streets, which intersect each other at right angles on the crest of the Quirinal. The Pincian is laid out in fine walks, which are the favorite promenade of the Romans; while between the Pincian and the Quirinal stands the great Barberini palace. On the summit of the Quirinal is the famous pontifical palace and garden; and in the square before the palace are the two colossal statues of Castor and Pollux, with their horses, whence the hill receives its other name of Monte Cavallo. On the Esquiline, which here joins the Quirinal, and forms the eastern extremity of the city, stands the magnificent church of St. Maria Maggiore; beyond it to the n., e and s., the Esquiline is entirely covered with gardens, villas, and fields, with here and there a church. The principal buildings on the capitol are three palaces, the work of Michael Angelo, which form three sides of a square, in the center of which stands the equestrian statue of M. Aurelius Antoninus. One of the palaces is the Capitoline museum, one of the finest collections of statuary and sculpture in Italy.

The third great division of the modern city lies on the right bank of the river, and is subdivided into two parts—the Vatican (otherwise called Il Borgo) and the Trastevere. Divided from the latter by an inner wall, the Borgo or Leonine city occupies the space between the bridge of St. Angelo and the piazza of St. Peter's. Its chief buildings are the palace of the Vatican (q.v.), and the basilica of St. Peter's (q.v.). Besides the Vatican and St. Peter's, the Leonine city contains the great hospital of the Santo Spirito, which accommodates annually 13,500 patients laboring under all diseases, whether mental or bodily. The castle of St. Angelo, with massive circular tower, called from its founder the "Mole of Hadrian," is surrounded with ramparts, ditches, and bastions, mounted with cannon, and forms the citadel of Rome.

To the s. of the Borgo, and between the Janiculum and the Tiber, is the Trastevere, properly so called. The Janiculum, a straight ridge, about a mile and a half long from n. to s., rises about 300 ft. above the level of the river. The northern half of its length is occupied by the long street called the Lungara, running closely parallel to the Tiber, which at the southern extremity of the Lungara, makes a bend to the e., and bounds the greater part of the Trastevere district. On the Janiculum is the villa Spada, near the gate, outside of which is the villa Pamfili, a favorite promenade of the Roman youth. On the same hill, the fountain called L'Acqua Paola, the largest in Rome, occupies a command-

ing site, and, as seen from a distance, resembles a triple triumphal arch, through which streams of water rush.

The churches, of which there are upward of 300, form a notable feature in Rome, from their architecture, their paintings, and other decorations. So also are the palaces of the aristocracy, which are often of great magnitude, with vast courts and spacious apartments. Of even better style as residences are the villas, both within and without the walls; while the handsome fountains, of which there are at least 12 principal ones, impart a cheerful and refreshing aspect to the city. There are three modern aqueducts, which keep Rome supplied with abundance of water; the *Acqua Vergine*, the *Acqua Felice* (the ancient *Acqua Marcia* and *Claudia*), and the *Acqua Paola* (the ancient *Alsetina*).

Rome, is on the whole, a healthy city, except at the close of summer and the beginning of autumn, when the malaria is prevalent. The Trastevere is its most uniformly healthy district, the inhabitants of which are superior in physical development to those of the other parts. The neighborhoods of the Pincian and the Quirinal, particularly the former, are most frequented by Englishmen. The trade of the city is insignificant, consisting of a few trivial manufactures of hats, silk scarfs, gloves, artificial feathers, false pearls, mosaic trinkets, etc., and of such articles as artists need and visitors fancy. The only great manufacture, if it can be called so, is that of pictures, original and copied; for the painting of these, Rome offers not only the advantage of numerous galleries of art, but purity of sky. The worst feature of Rome is its dirtiness. In Oct., 1870, Rome, along with the rest of the papal territory, was annexed to the kingdom of Italy, and is now the capital. The pope retains the rights of a sovereign within the Vatican.

ROME, a city, co. seat of Floyd co., Georgia; on the Selma, Rome and Dalton railroad; 60 m. n.w. of Atlanta at the junction of the Etowah and Oostenaula rivers, forming the Coosa; pop. '70, 2,748—1,005 colored. Rome was incorporated in 1848, and was occupied by Sherman when he was moving on Atlanta. The place derives most of its importance from its position near many rich iron mines, and contains a rolling-mill, machine-shops, and iron foundries; and there are six blast furnaces not far distant. The Coosa is navigable to this point.

ROME, a township and village of New York, on the Mohawk river, Erie canal, Black River canal, and New York Central railway, 100 m. n.w. of Albany. It contains a U. S. arsenal, court-house, jail, academy, 15 churches, 2 newspapers, and numerous manufactories. Pop. '70, 11,000; '75, 12,511.

ROME (*ante*), a city in central New York, incorporated 1870; at the junction of the New York Central, the Rome, Watertown and Ogdensburg, and the Rome and Clinton railroads; pop. '80, 12,045. It is 15 m. n.w. of Utica, and 38½ m. n.e. of Syracuse, at the head of the Mohawk valley. It stands the only land interrupting direct water communication between the Atlantic and the western lakes, and was formerly called *the carrying place*, i.e., the place where the boats were carried across. The town is regularly built on wide thoroughfares, crossed by streets at right angles, shaded in summer by beautiful trees. It has good educational facilities, a public library, 5 banks, and the Central New York institution for deaf mutes. The water supply is brought from the Mohawk river by works established in 1873. The battle of Oriskany was fought in the vicinity, fort Stanwix, besieged by the British in 1777, occupying the center of what is now the city. It was here that cheese was first made in factories; other manufactures are locomotives, agricultural implements, railroad iron, cigars, and patent medicines.

ROMEYN, JOHN BRODHEAD, D.D., 1777-1825; b. N. Y., graduated at Columbia college in 1795; studied theology and became pastor of the Reformed church, Rhinebeck, N. Y., 1799; of the Presbyterian church, Schenectady, 1803; of the First Presbyterian church, Albany, 1804; and in 1808 of the Cedar street Presbyterian church in New York, where he remained till his death. As a preacher he was among the foremost of his day. His ministry was very successful. His catechetical classes were crowded, and many young men became ministers from his congregation. Two vols. of his sermons were published. He was a trustee of Princeton college; active in the formation of the theological seminary, and was one of its directors; was one of the founders of the American Bible society in 1816, and its first domestic secretary.

ROMFORD, a market-t. in the co. of Essex; stands on the river Bourne, or Rom, 12 m. from London, on the Great Eastern line. The annual horse-fair commences on midsummer day, and lasts three days. There are extensive breweries of the famous "Romford ale." Agricultural implements are largely manufactured. Pop. '71, 6,335.

ROMILLY, Sir SAMUEL, English lawyer and law reformer; b. Mar. 1, 1757; was descended from a family of French Protestants, who, after the revocation of the edict of Nantes, emigrated to England. At the age of 16 Romilly was articled to Mr. Lally, one of the sworn clerks in chancery; and at 21 he entered himself at Gray's inn. At first he made little progress in his profession; but after a time he began to apply himself to the study of criminal law; and in 1789 entertaining, like many other English liberals, a sanguine expectation of the happy effects of the French revolution, he published a short pamphlet on the subject. In 1792, and again in 1795, he declined lord Lansdowne's offer of a seat for Calne. In 1806 he was, at the instance of Mr. Fox, appointed solicitor-

general in the Grenville administration. He unwillingly received the honor of knight hood; but the king having, for the last 20 years, knighted all his attorneys and solicitors-general on their appointment, would take no refusal. He was afterward returned for Queenborough, was one of the manager's of lord Melville's trial, and passed a bill to amend the bankrupt laws. In 1807 he went out of office, and was elected for Horsham, but being unseated, was returned for Wareham. He now devoted himself to ameliorate the severity of the criminal law, and proposed the abolition of the punishment of death in various cases of theft. He also published a pamphlet *On the Criminal Law as it relates to Capital Punishments*. His bills were, session after session, opposed by the government of the day, the judges, and many of the bishops, as dangerous innovations; but Romilly nevertheless persevered, and lost no opportunity of protesting against the severity and frequency of capital punishments. The measures he proposed for mitigating the severity of the criminal law were, for the most part, carried by others; but he framed an act for rendering the punishment of high treason less barbarous, and another for taking away corruption of blood, as a consequence of attainder of felony. He took an active part in the anti-slavery agitation, and in opposing the suspension of the habeas corpus act, the spy system, and the despotic acts of the government. In 1818 he was spontaneously chosen by the electors of Westminster as their representative. The death of his wife, following upon prolonged mental exertion, preyed upon his mind, and three days afterward (Nov. 2, 1818), he died by his own hand. He had at this time attained the foremost rank at the chancery bar, and his professional gains were said to average £14,000 a year. His death excited profound sympathy, and was considered a public calamity. His *Speeches in Parliament* have been published in two vols.; and his autobiography, with a selection from his correspondence, admirably edited by his sons, has also been published in two vols.—His second son, BARON ROMILLY, educated at Trinity college, and called to the bar at Gray's inn, 1827, was made solicitor-general in 1848, attorney-general in 1850, master of the rolls in 1851, and created a baron in 1866. As master of the rolls Romilly incidentally rendered great services to his country, by superintending the publication of public records tending to throw much light upon English history and events. He died on Dec. 23, 1874.

ROMMANY LANGUAGE. See GYPSIES, *ante*.

ROMNEY, GEORGE, 1734-1802; b. Lancashire, England. His father was a cabinet-maker, but young Romney displayed such taste for drawing that he was apprenticed to a portrait-painter. For several years he was a portrait-painter in Westmoreland. In 1762 he came to London, and his first historical picture, "Death of King Edmund," received a prize from the society of arts. He studied in Italy, and on his return was patronized by many of the nobility, and made a large income by his profession. He was a man of great eccentricity, and left much unfinished work. "Milton Dictating to his Daughters," and "Tantania with her Indian Votaress," are considered his best pictures.

ROMORANTIN, a small t. of France, in the dep. of Loir-et-Cher, 25 m. s.e. of Blois. At the siege of this town by the Black Prince in 1356, artillery is said to have been first used. Various woolen fabrics are manufactured. Pop. '76, 7,436.

ROMPU, in heraldry, a term applied to a chevron when the upper part is taken off, and remains above it in the field.

ROMULUS, the mythical founder of the city of Rome. His name is only a lengthened form of Romus, and he is therefore to be regarded rather as a symbolical representation of the Roman people than as an actual individual, like Æolus, Dorus, and Ion, the eponymous ancestors of the Æolians, Dorians, and Ionians. But though the legend of Romulus cannot be accepted as history in its details or its outlines, it is nevertheless interesting to know how, after the lapse of years, when Rome had become a place of importance, its inhabitants tried to conceive a probable origin for it. We will therefore relate the story of Romulus as it is usually given. At Alba Longa, in Latium, there had ruled for some centuries a line of kings descended from the Trojan prince, Æneas. One of the latest of these, at his death, left the kingdom to his eldest son, Numitor. Amulius, a younger brother of Numitor, who was ambitious, deprived the latter of the sovereignty, murdered his only son, and compelled his only daughter, Silvia (generally, but incorrectly, called Rhea Silvia), to become a vestal virgin, thereby hoping to secure immunity for his crime. But Silvia having become the mother of twins by the god Mars, his fears were aroused, and he resolved to drown all the three. A cradle containing the babes was thrown into the Anio, whence it was carried into the Tiber. That stream was then in flood, and had overspread its banks far and wide. The cradle was stranded at the foot of the Palatine, and the infants thus wonderfully saved from death by drowning, were no less wonderfully saved from death by hunger. A she-wolf carried them into her den, near at hand, and suckled them, while a woodpecker brought them whatever other food they wanted. This marvelous spectacle was at length beheld by Faustulus, the king's shepherd, who bore the infants home to his wife, Acca Larentia, and had them brought up with his own children. A strife having one day arisen between them and the herdsmen of Numitor, who staled their cattle on the Aventine, Remus, one of the twins, was taken prisoner, and carried off to Numitor. When the latter looked on the youth, he could not help thinking of his grandsons; and the story of the miracu-

lous preservation of the twins strengthened the suspicions that were beginning to form in his mind. Romulus now made his appearance, accompanied by his foster-father; an *éclaircissement* took place: Numitor acknowledged the boys as the sons of his daughter Silvia, and they immediately proceeded to avenge the family wrongs, by slaying Amulius, and placing their grandfather on the throne. But, continues the legend, Romulus and his brother did not care to remain in Alba Longa; they loved their old abode on the banks of the Tiber, and resolved to build a city there. The Palatine was chosen (by augury) for the site, and Romulus, yoking a bullock and a heifer to a plowshare, marked out the *pomarium*, or boundary, on which he proceeded to build a wall. Remus laughed at the idea of keeping off enemies by such means, and to show its inefficiency, scornfully leaped over it, whereupon Romulus slew him, but was immediately struck with remorse, and could obtain no rest till he had appeased the shade of his brother by instituting the *lemuria*, or festival for the souls of the departed. The next thing which Romulus did was to erect a "sanctuary" on the Capitoline for runaway slaves and homicides, and by this means he soon increased the number of his followers; but as wives were much wanted, Romulus tried to obtain them legally from the neighboring states. His efforts, however, failed: a "runaway slave" not being considered a desirable match for his daughter by a Latin or Sabine paterfamilias, and he was compelled to have recourse to stratagem. This led to the celebrated *Rape of the Sabine Women*, the incidents of which are too familiar to require narration. The consequence of this wholesale abduction of virgins was a series of wars, in which, however, Romulus was invariably victorious, until Titus Tatius, at the head of a large army of Sabines, drove him from the open fields, and forced him to take refuge in his city on the Palatine. Romulus had also garrisoned the Capitoline; but the treachery of Tarpeia, a daughter of a lieutenant of the fort, placed it in the hands of his adversaries. Next day a battle took place in the valley between the two hills. It was long and fiercely contested. Sabines and Romans fought till they were exhausted, when the Sabine women rushed in between their husbands and fathers, and implored them to be reconciled. This was agreed to, and henceforth they resolved to unite and to form only one people—the followers of Romulus dwelling on the Palatine, those of Titus Tatius on the Capitoline and Quirinal. On the death of Titus Tatius, who was murdered at a festival held at Lavinium, Romulus became sole sovereign, and subsequently—according to a later legend—made successful war against the Etruscan cities of Fidenæ and Veii. The political organization of the Roman *populus* ascribed to Romulus is given under **ROME**. After a reign of 37 years, Romulus was miraculously removed from earth. While he was standing near the "Goat's pool," in the Campus Martius, reviewing his militia, the sun was eclipsed, and a dark storm swept over the plain and hills. When it had passed, the people looked round for their king, but he was gone. His father, Mars, had carried him up to heaven (like the prophet Elijah) in a chariot of fire. Some time after he reappeared in a glorified form to Proculus Julius, announced the future glory of the Roman people, and told him that henceforth he would watch over them as their guardian god, under the name of Quirinus. The festival of the Quirinalia (Feb. 17) was instituted in his honor; but the nones of Quintilis (July 7) was the day on which he was believed to have departed from earth.

ROMULUS AUGUSTULUS. See **ODOACER**.

RONALDSHAY, NORTH AND SOUTH, two of the Orkney islands (q.v.). *North R.*, situated at the n. extremity of the Orkneys, has an area of 4 sq. miles. It is partly under tillage, and partly in pasture. Sea-birds in great variety frequent the coast, and lobsters and cod are fished. Pop. '71, 539.—*South R.*, washed on the s. by the Pentland firth, has an area of about 18 sq. miles. St. Margaret's Hope, on the n. coast, is a safe and convenient harbor. The inhabitants derive their subsistence for the most part from fishing for cod and herrings. Pop. '71, 2,501.

RONCESVALLES, one of the valleys in Navarre, on the southern side of the Pyrenees, about 20 m. n.e. of Pamplona, has been rendered famous in poem and story as the scene of a defeat sustained by the army of Charlemagne at the hands of a combined force of Arabs, Navarrese, and French Gascons in 778. Charlemagne, allured by the promise of the feudal supremacy of Catalonia, opened a campaign in aid of the viceroy of that province against the Mohammedans. With a powerful army he passed the Pyrenees, penetrated into Navarre, took Pamplona, the capital, and leveled the walls of the city with the ground. Clearly this was not part of his programme as the champion of the Christian religion in Spain; for Pamplona was the capital of a Christian state, and it is even asserted that prior to 370 A.D. Moors had not been admitted within its walls. Pressing onward, Charlemagne subdued a great part of the country between the Pyrenees and the Ebro; but on his return northward, while threading the defiles of the mountains near Roncesvalles, his rear-guard was furiously assailed and annihilated by a mixed force, of which a body of Navarrese, enraged at the destruction of their capital, formed an important section. Eginhard, the secretary of the emperor, tells us that the whole rear-guard, including many generals and chief nobles, was totally destroyed, and that the spoil of the campaign, together with the whole baggage of the army, fell into the hands of the victors. In this action fell Roland (q.v.) the famous paladin, and the hero of a hundred romances. The older poets found abundant material in the battle of Roncesvalles, in which, on the one side, ranked the most distinguished chivalry of that time,

and on the other the patriotic, high-spirited mountaineers of Navarre; and in recent times the incident has contributed a spirited allusion to sir Walter Scott's *Marmion*:

"Oh, for a blast of that dread horn,
On Foutarabian echoes borne,
That to King Charles did come,
When Roland brave, and Olivier,
And every paladin and peer,
On Roncesvalles died!"

RONCIGLIONE, a city of central Italy, in the province of Rome, and 12 m. s.e. of the city of Viterbo. Pop. 6,084. It has a fine cathedral, a Gothic castle, and several fine old palaces. Hats, cloth, and cotton goods are manufactured, and iron, brass, and copper works are in operation. In the neighborhood of the city there are sepulchral vaults, hollowed out in the porous rock (*tufa*), and several sulphureous springs.

RONDA, a picturesque Moorish t. of Spain, in the modern province of Malaga, on the Guadiaro, 50 m. n.n.e. of Gibraltar. Situated at a considerable elevation, the climate of Ronda is unusually salubrious, and the town is a favorite summer retreat for the wealthy of Seville, Ecija, and Malaga. The great annual fair takes place in May, at which time Ronda, its bulls, and bravoes are seen to the greatest advantage. On such occasions the small but active horses of the town are sold in large numbers to officers from Gibraltar; and leather, saddlery, embroidered gaiters, garters, and mantas are also sold. Pop. 23,500.

RONDELET, WILLIAM, a French naturalist, b. at Montpellier, in 1507; died 1566. He became a medical practitioner in Montpellier, and professor in the medical school there. He was a zealous student of natural history, and particularly distinguished himself in ichthyology. His *Histoire entière des Poissons* (Lyons, 1558) was one of the first works which contributed much to the progress of that branch of science.

RONDO (Ital.), or **RONDEAU** (Fr.), originally a little poem of 13 lines, divided into three unequal strophes; the two or three first words of the first line serve as the burden, and recur after the 8th and 13th line. Thence, in music, the term has come to denote a light air, consisting of three or more strains, the first terminating in the original key, and each of the others so constructed as to conduct the ear back to a repetition of the first strain. In a more general sense, the name rondo is also often applied to any light lively tune which ends with the first strain repeated.

RONDOUT, N. Y. See KINGSTON, N. Y.

RONGE, JOHANN. See GERMAN CATHOLICS.

RONSARD, PIERRE DE, a celebrated French poet and reformer of French poetry, was born at the château de la Poissonnière, in Vendômois, Sept. 11, 1524. At the age of nine he was sent to the collège de Navarre, but was soon removed, and shortly after entered the service of the dauphin as page. Handsome, well-made, and excelling in all bodily accomplishments, he soon became a general favorite. When his master died (1536), he became attached to the household of the duc d'Orléans, second son of the king, accompanied James V. of Scotland back to his kingdom, with his new bride, Marie de Lorraine, in 1538; and after a stay of nearly three years at the Scottish, and six months at the English court, he returned to France, and re-entered the service of the duke. A little later, however, on recovering from a serious illness, he found himself afflicted with a deafness, which led him to resign the pursuits of arms for those of letters. With this view, he took up his residence in the collège de Coqueret and studied hard for five years. He had previously acquired a knowledge of Latin and of several European languages. His own language, as a vehicle of literary instruction, was a subject of continual meditation with him. Familiar now with the masterpieces of Greece and Rome, he wished (like a true child of the renaissance, as he was) to invest the national poetry with a classic dignity and grace. Several of his fellow-students shared his opinions and enthusiasm; and in 1549, one of these, Joachim du Bellay, published what may be called the first manifesto of the new school, the *Illustration de la Langue Française*. Without denying the necessity or the value of the change thus begun by Ronsard and his friends, we may just remark in passing that the most intelligent French critics now admit that it was too radical, too absolute; it broke abruptly with the national traditions and tendencies, and more than anything else helped to fix that pseudo-classicism of style which was subsequently brought to disastrous perfection in the *splendid arctia* of Corneille and Racine. In 1550 Ronsard himself appeared in the field with his *Amours* and *Quatre Livres d'Odes*. The volume excited the most violent opposition among the adherents of the older national school, and it cannot be said that their antipathy was altogether unreasonable. Rabelais (q.v.) was conspicuous among the adversaries of the new school, and made Ronsard the subject of some bitter sarcasms. But on the whole, the classic party had the best of it. Its efforts were in harmony with the general intellectual tendencies of the time, and, besides, Ronsard was just the man to make powerful friends. Marguerite, sister of Henry II., granted him a pension; the illustrious chancellor de l'Hôpital warmly encouraged him to persevere in his course; and both Henry II. and François II. covered him with honors and pensions. In 1553 a new edition of the *Amours* was published; in 1555 the first, in 1556 the second, volume of his *Hymnes*; and finally, in 1560, an edition of his

whole works up to this period, in four volumes. The admiration of his contemporaries intoxicated him; and he did not shrink from conferring on himself a sort of anticipatory apotheosis. During the religious wars that devastated France, Ronsard made himself noted by the violence of his attacks on the Calvinists or Huguenots. Twenty days after the massacre of St. Bartholomew he published *La Françoise*, an epic fragment. He meant that it should comprise 24 books, but he only finished 4, having, perhaps, discovered that the subject was not happily chosen, and that epic poetry was a touch above him; yet such was the belief in his genius, that not a few of his contemporaries did not hesitate to prefer it to the *Aeneid*. Charles IX. could only express his delight by conferring on the lucky bard additional favors. He gave Ronsard the abbey of Croix-Val and Belozane, and the priories of Saint-Cosme, of Evailles, etc. But the "disorders" of what his countrymen called his "joyous" youth now began to tell upon him, and, afflicted with premature infirmities, he retired to the abbey of Croix-Val, where he spent most of his remaining years in lettered ease, honored with the attentions of the great to the last. Queen Elizabeth of England sent him a set of diamonds, and Mary Stuart, from her prison, a set of plate worth 2,000 crowns, with the inscription:

A Ronsard, l'Apollon de la Source des Muses.

In 1584 he collected and republished his whole works in one volume, and died on Dec. 27 of the year following.—See Saint-Beuve's *Œuvres Choisies de P. Ronsard, avec Notice, Notes et Commentaires* (Paris, 1828).

ROOD, a measure of surface, the fourth part of an acre, and containing 40 square poles or perches. It is quite different from the rood used in estimating mason-work, for which see **ROD**.

ROOD (Anglo-Sax. *rod*, a cross), a figure of the cross, and generally of the crucifix. The word is also applied to the actual cross on which our Lord suffered, although, when used to signify the relics of the true cross, it is commonly found with the prefix **HOLY**, from which Holyrood at Edinburgh derives its name; but in most ordinary signification it is applied to the large and striking crucifix which was placed at the entrance of the chancel in most mediæval churches. On either side of the cross most commonly were placed figures of the blessed virgin and St. John, in allusion to John xix. 26. The manner of placing the rood differed in different churches; most commonly it stood upon a gallery or screen at the entrance of the chancel, which was called the **ROOD-LOFT** or rood-screen. In England, after the reformation, the rood of course was, as a rule, removed from all churches; but in a few country churches it still remains in a more or less perfect form. A very perfect foreign example of the rood is in the great church of Louvain.

ROOF. The coverings of houses vary in every climate and every age. In warm countries, such as India, flat roofs, covered with cement, are almost invariably used. The frequent allusions in the Bible to the house-top show that the roofs of Palestine were flat in ancient times as they are now. Those of Egypt and Assyria (q. v.) were also flat, and were composed of wooden beams, covered with thick layers of earth, forming an impenetrable protection from the fierce heat of the sun. In countries where the climate is milder, and rain more abundant, roofs sloping from a central ridge are the usual form. The Greeks and Romans constructed their roofs in this way. Those of Greece were, in important works, covered with marble slabs, carefully grooved together, so as most effectually to protect the interior from rain. In the common buildings of Greece and Rome, roofing-tiles are used.

In the rainy climate north of the Alps, roofs of a much steeper pitch are employed, so as the more readily to throw off rain and snow. The angle at the ridge is not uncommonly a right angle; and roofs slated in the usual way should never be less than $\frac{1}{2}$ of the span (or width between supports) in height. When large slates are used, $\frac{1}{3}$ of the span in height will suffice.

When roofs are well constructed, they serve to tie the walls together, and thus to strengthen the building. In order to do this effectually, they must not be made of too great weight, otherwise they crush the walls. The actual covering of the roof and its supports are therefore made as light as possible, and the strength concentrated in principals or trusses. The following are the commonest forms of these trusses: Fig. 1 represents what is called a king-post roof (A being the king-post), and fig. 2 a queen-post roof (B, B being the queen-posts). The latter is used for wider spans than the former, and has the advantage of leaving the center of the roof clear of timbers, so that attic rooms may be introduced. The other members of the truss are named as follows: C, C, C, C, braces or struts; D, D, tie-beams; E, E, E, E, principal rafters; F, F, ridge-pieces; G, G, etc., purlins; these and the ridge-piece are laid across from truss to truss, and carry the common rafters J, J. H is a collar. K, K, the pole-plates, and L, L, the wall-plates, are laid along at the wall-head, to bind the wall and feet of rafters together.

The above system of construction has been used from a very early time to the present day. The early Christian, and probably the Roman basilicas, had exactly such roofs. In early Gothic times roofs of this kind were made ornamental by carving the king-post and molding the tie-beam. During the decorated style, an arch, or a series of cants was introduced. As the style progressed, curved braces were placed under the tie-beam

to support it; these were carved, and rested on elegant corbels, the spandrels between the braces and the wall being filled with tracery. In the perpendicular style, the central part of the tie-beam is cut away, and the beautiful hammer-beam (q.v.) roofs of the period become usual. The roof of Westminster hall is one of the finest examples of this kind of roof. These open timber-roofs are used both in churches and halls, but

FIG. 1.

FIG. 2.

chiefly in the latter, as the church roofs were frequently vaulted. See VAULT. In modern times, when great spans have to be roofed over, combinations similar to those used in lattice bridges (q.v.) are required. Recently iron has been introduced, and by means of it, spaces of almost any width can be roofed over.

ROOK, *Corvus frugilegus*, a species of crow (q.v.), very common in the southern parts of Britain, and found in many parts of Europe and Asia, even to Japan; about the same size with the common or carrion crow, but easily distinguished from it, even at a distance, by its color, which is a glossy, deep-blue black, in certain aspects grayish. On a nearer view, a more notable distinction is found in the naked warty skin at the base of the bill, extending back rather beyond the eyes, and pretty far down on the throat. Still more different are the habits of the birds, the common crow frequenting lonely situations, and preying much on carrion; the rook choosing rather the neighborhood of human habitations, and seeking its food, both animal and vegetable, chiefly in cultivated fields. Moreover, whilst the common crow is solitary, the rook is gregarious; and very large companies often assemble in *rookeries*, making their nests in close proximity, generally in tall trees, the same tree often sustaining many nests. So far are they from disliking the companionship of man, that it is not uncommon for rooks to build their nests in the trees which grow in the midst of great cities. A tree even in Cheapside has been occupied by rooks' nests. Few cities or large towns in Britain are without rookeries, sometimes of considerable magnitude. The smoke seems to be disregarded by the birds. The rook is nowhere more abundant than in England and the s. of Scotland, but it becomes rare in the northern parts of Scotland, and is not to be seen in Orkney and Shetland; probably, however, not on account of climate, but from want of trees. Sometimes, indeed, rooks have been known to make their nests in steeples, vanes, etc., but rarely. They have been observed to avoid with peculiar caution trees which are decaying and likely soon to be blown over—perhaps, however, on account of the state of their twigs—and trees that are marked on the trunk for cutting down. They are notable for the care with which they guard against the approach of danger when they are feeding in fields, a few solitary rooks perched on trees, palings, or the like, being ready to give the *cue* of alarm to the often very numerous flock. They are also notable for their dread of a gun, the danger of which they seem to know; so that a man without a gun may approach them much more nearly than a man who carries a gun, and even a stick lifted up is apt to excite their alarm. It is also commonly believed in some districts that they know Sunday, and are less timid of the approach of man on that day than on other days of the week. A gig or carriage may approach them much more nearly than a man on foot, and they are very indifferent about the passage of a railway train. It is interesting also to observe how soon they become familiarly acquainted with scarecrows. The nests of rook are formed of twigs, lined with grass and fibrous roots; generally containing four or five eggs, of a pale greenish color, blotched with dark greenish-brown. During the nest-making time, rooks rob each other in a remarkable manner, and prodigious quarrels arise in rookeries on this account. Any pair attempting to found a separate colony on a tree far apart, are apt to be assailed by the whole force of the rookery, and the nest pulled to pieces, its materials of course being carried off.

Rookeries are sometimes of great size, and immense flocks of rooks are often to be seen feeding together in fields, or darkening the sky in their outward or homeward flight. Farmers very often complain of them for rooting up grass and young corn, and for injury to young potatoes, turnips, etc.; but on the other hand, it is urged that they are of very great use by eating up wire-worms, cock-chaffer grubs, and other insect larvæ, slugs, etc., and that the grass pulled by them is very often that of which larvæ have already devoured the roots. The truth appears to be that rooks in moderate numbers are very useful; but that it is possible to protect them too much, until their multitudes

become a nuisance in a neighborhood, the insufficient quantity of their favorite food compelling them to other resources not so agreeable to the farmer; and at least in such circumstances they certainly devour large quantities of grain.

It has been supposed that the naked space at the base of the bill of the rook is in consequence of its habit of digging in the ground, and in support of this view it is urged that this space is feathered in the young bird; but it is found to become naked even in rooks caged from the beginning of their life, and there are numerous other arguments against the supposition. The naked space must be regarded as a natural peculiarity of the species.

The same rooks seem to take possession of their old nests year after year, repairing them, and not building new ones. The time of building and repairing nests is one of prodigious clamor in the rookery, and begins early in spring. The male rook feeds the female assiduously during incubation, and sometimes takes her place on the nest. Both parents bring food to their young ones.

The rook is capable of being tamed, and tame rooks have been known to exhibit something of the imitative power of voice possessed by several other birds of the same family.

White, cream-colored, and pied rooks are now and then seen. These peculiarities of plumage probably arise from a more or less diseased condition.

ROOKERIES, in law. Though rooks are often encouraged to breed in and to frequent the trees of an estate, yet they are not protected in any way by laws resembling the game laws, which inflict penalties for illegally trespassing to take or kill them. The rooks, while frequenting the rookery, whether it is an ancient or a newly-made rookery, are in the ordinary category of wild animals, and the owner of the estate or ground where the trees grow has no more property in them than any other person. The owner of a rookery once brought an action against a neighbor for shooting at the rooks as they were flying over the neighbor's estate toward the rookery; but the English courts held that no such action was maintainable, for every person may shoot and catch a wild animal upon his own lands, if he pleases. The law is the same in Ireland and Scotland. No person can be given into custody, or fined, or punished by justices of the peace for trespassing in order to shoot at rooks; nevertheless, the owner or occupier of the ground trespassed upon may bring an action of damages against the trespasser.

ROOKE, Sir GEORGE, a distinguished British admiral, was b. in the year 1650 near Canterbury, at the country-seat of his father, sir William Rooke. Having entered the navy, he found himself, at the age of 30, a post-capt.; and in 1689 he was promoted to the rank of rear-admiral. He was engaged in the action off Beachy Head between the earl of Torrington and the French admiral De Tourville; and in 1692 he took part in the memorable battle of La Hogue, fought between the French fleet and the combined English and Dutch force under admiral Russell. On this occasion his services were of the most brilliant and dashing character, and in acknowledgment of them he received the rank of vice-admiral of the red, the honor of knighthood, and a pension of £1000 a year. His next important service was the destruction of a Spanish plate-fleet in the port of Vigo; and in July, 1704, in conjunction with sir Cloudesley Shovel, he accomplished the capture of Gibraltar. Such was the vigor of the operations, that a single week sufficed for the reduction of a fortress which, as having defied the most formidable, elaborate, and prolonged attack, has since been reputed impregnable. On Aug. 9 of the same year, he engaged off Malaga a French fleet of much superior force, under the comte de Toulouse, and fought one of the bloodiest of our naval battles, the honors of which fairly remained with the English, though the escape of the enemy's force rendered it by comparison a barren triumph. The struggle lasted through nearly a whole day; the French loss was upward of 3,000, the English upward of 2,000 men. On the return of sir George to England, he was received with marked distinction by queen Anne; but finding the hostility of the government directed against him on the merely partisan ground of his having previously, as member for Portsmouth, allied himself with the opposition, he resigned his employments, and along with them his seat in parliament; and till his death, which took place on Jan. 24, 1709, led the life of a quiet country gentleman on the family property in Kent. He was thrice married, and left behind him one son by his second wife.

ROOKS, a new co. in n.w. Kansas, crossed by the s. fork of Solomon river; 900 sq. m.; pop. '80, 8,113. The surface is undulating and mostly prairie. Co. seat, Stockton.

ROOMELIA. See **ROUMELIA**, *ante*

ROON, ALBRECHT THEODOR EMIL, Count von, b. Germany, 1803; educated in Berlin; in 1819 was made second lieutenant, and in 1828 was appointed teacher in the military academy; and in 1832 was ordered to the headquarters of the Prussian corps of observation on the Rhine. In 1833-34 he was employed in the topographical bureau, and in 1835 was relegated to the grand general staff. After various promotions he was made commander-in-chief of the 20th brigade of infantry in 1856, commander-in-chief of the 14th division in Düsseldorf in 1858, and six months later became lieutenant-general. In 1857 he became minister of war, and in 1861 minister also of marine, holding that office for 10 years. On the resignation of prince Bismarck, Dec. 21, 1872, he was made president

of the cabinet, and soon afterward field-marshal. He resigned Nov. 9, 1873, as Bismarck found it necessary to combine his position as imperial chancellor with that of president of the cabinet. He received the cross of the black eagle from the king after the war of 1866 for his services in organizing the army, and won considerable distinction during the Franco-German war.

ROOP, a co. in extreme n.w. Nevada, adjoining California and Oregon, pop. '80, 286—254 of American birth. The surface is mountainous, and traversed by the Granite range. There is much beautiful scenery; Pyramid lake, about 30 m. long, is visited by many tourists. Timber and water are scarce. Gold and silver exist.

ROOSEVELT, ROBERT B., b. N. Y. 1829; educated as a lawyer, and practiced at the bar of New York for 20 years. In 1868 he was appointed commissioner of fisheries for the state of New York, a position which he still holds; much of his life having been devoted with enthusiasm to pisciculture, and American fishery interests. He edited the *New York Citizen* from 1868; was elected to the 42d congress as a democrat, and served 1871-73. He has published *Game Fish of the North*; *Superior Fishing*; *Game Birds of the North*; *Five Acres Too Much*, etc.

ROOT, in botany, sometimes designated the *descending axis* of a plant, that part by which it is fixed to the soil and derives nourishment from the soil. The root is developed in the germination of the seed, at or about the same time with the stem, and forces its way downward as the stem grows upward. The root differs from the stem in the irregularity of its ramifications, in the want of a central pith, in the want of buds, in the want of scales or of scars to indicate their former presence, and in the want of stomata. The axis of the root giving off branches, these finally subdivide into *fibrils*, which are little bundles of annular ducts, or sometimes of spiral vessels incased in woody fiber, and covered with a lax cellular integument. The apex of each fibril is sometimes called the *spongiote*; it consists of extremely lax cellular tissue, and has the property of absorbing fluids with great rapidity, thus subserving the nourishment of the plant. See ENDOSMOSE.—Aerial roots occur in some plants, as in some *epiphytes*, the banyan, mangroves, etc.; by which nourishment is derived from the air, in addition to that obtained through the leaves and bark, or by which the branches seek to connect themselves anew with the ground for support and nourishment; and many plants, as willows, produce adventitious roots very readily, when any portion of the stem or branch is imbedded in moist soil, of which advantage is taken for their artificial propagation.—The central axis of many roots goes deep into the ground in a tapering manner, forming what is called a *tap-root*; other roots have the descending axis very short, and are called *fibrous*. The roots of some plants spread very widely; those of others occupy a very limited space. Roots of coniferous trees and palms are very small when compared with the appearance of the tree above ground.—Tap roots sometimes assume a conical form, as in the carrot; others are variously developed in thickness at the upper part, as in the turnip and radish. Tubers (q. v.), bulbs (q. v.), and corms (q. v.) are peculiar developments, evidently intended to secure a store of nourishment for the plant, but which also are very frequently available for the use of man.—Esulent roots are numerous, and many roots also contain secretions either peculiar to themselves, or more abundant than in the other parts of the plant, and become therefore useful in medicine or in the arts, while some are very poisonous. The roots used for food, besides the tubers, bulbs, and corms above mentioned, are generally those which are thick and fleshy. The plants to which they belong are of very different genera and orders—some of the natural order *crucifera*, as the turnip and others of the genus *brassica*—some of the order *chenopodiacea*, as beet and mangold wurzel—some of the order *umbellifera*, as the carrot, parsnip, etc.—some of the order *leguminosae*, as the *pachyrhizos angulatus*, which is cultivated in all parts of the East Indies, and *P. trilobus*, which is cultivated in Cochin China. In many of the lower classes of plants, particularly the algae, there is no root whatever, although the plant is often attached by a base.

ROOT, in philology, is that part which is common to a group of allied words—the germ out of which they have all sprung. It is arrived at by taking away the formative parts—the suffixes and affixes, and reversing any change that their presence may have caused. Thus, in co-in-*cid*-ence, the root syllable is *cid*, the primary form of which in Lat. is *cad*, to fall. It is seldom that this analysis can be successfully performed with only one language; in order to get at the true root, the corresponding words in all the languages of the same family must be compared. Thus, in the Eng. words *story*, *history*, *historical*, *historically*, *histor* would seem to be the root; but by comparing the Greek with the Lat. and Sanskrit, we arrive at a syllable *vid*, meaning to see or know, of which the Eng. (to) *wit* (wist) is only another form. And even then we are not sure that we have arrived at the original and most simple form. Thus, Eng. *yoke*, Lat. *jugum*; come from the syllable *jug*, to join, seen in Lat. *ju(n)go*, Gr. *zeugo*; and this might be rested in as the root, were there not a simpler form, *ju*, preserved in Sans., and having the meaning of mingling or being together; this, which may be taken as the primary root, gives rise to the two secondary roots or modifications, *jug*, to join, and *yudh*, to fight (i. e., to join battle).

The roots of the Aryan languages are always monosyllabic, as *i*, to go; *ga*, to go; *ad*, to eat; *vak*, to speak; *star*, to strew. They are divisible into two classes, the one

expressing some action or general property, as in the instances now given; the other indicating relative position, as *ma*, here or me; *ta*, there or that. The one class are called *predicative* roots; the other *pronominal* (see PRONOUNS, PREPOSITIONS). They all expressed primarily some physical notion or relation palpable to the senses; but from these the transition to the impalpable conceptions of the mind is natural and obvious; thus, *vid*, to see, served also for to know. The notion expressed by a root-word is always of a very general kind; but by a variety of expedients, such as lengthening the vowel, reduplication of the syllable, prefixing and affixing letters and syllables (many of which at least are evidently pronominal roots), and composition with other predicative roots, one germ gives rise to a whole group of words expressive of the specific applications of the generic idea. Thus, from the root *spac* or *spee* (in Gr. *skepe*), to look, have sprung a numerous family of words in the English and other kindred tongues: *spy*, *despise* (to look down upon), *spite* (through Fr. *despiti*), *respite*, *respectable*, *suspicion*, *prospect*, *inspect*, *auspices*, *speculum*, *species* (i. e., the appearance or individual form, as opposed to the kind or genus), *spices*, etc.

Roots, in the Aryan languages, never enter into speech in their pure and simple form, to make them words, they almost always take on the addition of a pronominal element. Thus, the reduplicate root *da-da*, having the sense of giving, becomes, by the addition of *mi*, my, the word *da-dā-mi*, I give; *vak*, to speak, by affixing *s* (for *sa*, that), becomes *vaks*, in Lat. *vox* (*voke*), voice (i. e., that speaking). See INFLECTION.

It requires but a few germs to produce, by the processes above described, the most copious vocabulary. The 50,000 words of the Chinese dictionary are formed from 450 roots; those of Hebrew and of Sanskrit are reckoned at about 500; and there are probably not many more in English (see Max Müller's *Lectures*, 1st series, p. 252). The theories as to the origin of the roots themselves, and why a particular thing or notion should have become associated with a particular sound more than with any other, are noticed under PHILOLOGY and ONOMATOPEIA.

ROOT, in algebra, denotes any value of the unknown quantity in an equation, which will render both sides of it identical. See EQUATION, INDETERMINATE PROBLEMS, IRREDUCIBLE CASE, etc. The determination of the roots of equations, either formally or actually, constitutes the greater portion of the science of algebra, while the approximation to roots of those equations whose degree is still beyond a general solution (4th and upward) forms almost a separate branch of itself. Roots are divided into various classes; they are *real* when they consist of numerical quantities positive or negative; and *imaginary* when they assume the form $a + b\sqrt{-1}$.

ROOT-MILDEW, a name given, not to any well-determined species of fungus, but to certain *mycelia*, which infest the roots of peaches, apples, roses, currants, etc., and cause their death. The tree or shrub is often very suddenly cut down, from apparently perfect health. The roots are found more or less decayed, and covered with filmy white threads. The *mycelium* is supposed to belong to species of *polyporus*. In some plants, as roses, the state of the bark just above the soil is believed to be premonitory of the disease, which may perhaps then be arrested by washing with a solution of corrosive sublimate. But the mycelium is not easily destroyed, and a tree of the same kind should not be planted where it has proved fatal.

ROOT-PARASITES, plants which grow upon, and derive their nourishment from, the roots of other plants. Such are the broom-rape (*orobanchæ*, (q. v.), species of *thesium*, etc., and the *rafflesia* (q. v.), with other *rhizanthæ* (q. v.).

ROOT-STOCK, or RHIZOME (*rhizoma*), in botany, a stem running along the surface of the ground, partially covered with soil; sending out roots from its lower side, and leaf-buds from its upper. The common yellow iris affords a very perfect example of it. Many ferns have root-stocks. The root-stock is often regarded as a creeping root; it is really, however, not a root, but a stem.

ROOT, GEORGE FREDERICK, b. Mass., 1820; partner with A. N. Johnson as teacher of music, and organist 1838-43; taught music in New York 1844-45; in 1860 became a member of the Chicago music firm of Root & Cady. He has composed many popular songs, and edited numerous books of sacred music, which have been widely used.

ROPE AND ROPE-MAKING. Ropes are usually made of vegetable fibers, and differ only from twine in their much greater thickness. The fiber most commonly used in Britain is hemp; but large quantities of plantain fiber, called manilla hemp, made from the leaf-stalks of *musa textilis*, are also employed, especially for the large ropes used for various purposes on board ships. Ropes consist of many thicknesses of yarn, which is spun by hand in places called rope-walks. The spinner has a large bundle of the fiber loosely gathered round his waist, from which he pulls out a few fibers, and attaches them to a hook in the turning-wheel or whirl, which is stationary, and is worked by an assistant. Experience teaches him what number of fibers to draw out, and how to twist them so as to hold firmly on to the hook. He then walks slowly backward down the rope-ground, gradually drawing out or regulating the pulling out of the fibers so as to make an equal yarn, which receives the necessary twist from the whirl. When he has got to the end of the walk, another spinner takes the yarn from the hook of the whirl, and fixes it to a reel, which is then set in motion; and he attaches a second

portion of hemp from his own supply to the hook, and proceeds down the walk as the previous one had done. In the mean time, the first spinner gradually walks up the ground, carefully guiding his length of yarn as it is wound on the reel. When he reaches the reel, it stops, and he waits until the second spinner's length is completed. He then in his turn takes it off the hook, and twists it on to his own; and the reel being again started, receives the additional length from the second man, and so on until the full length required is made up. The next operation is called *warping*, and consists in stretching out the number of yarns required for a rope. These are all slightly twisted again separately, and stretched to an equal length. Then, if they are intended for tarred ropes, each yarn is drawn separately, either lengthwise or in a hank, through a kettle of hot tar. The superfluous tar is removed by drawing it through a hole lined with oakum. In the next process, called *laying*, two or more yarns are attached to hooks on a whirl, so that when it is turned they will be twisted together the contrary way of the original twist they received in the first spinning. When this is done it is called a strand. Then as many of these strands as are required for the rope are stretched at full length, and are attached at each end to whirls. One of the whirls has but one hook, to which all the strands are attached; the other has as many hooks as there are strands, one always being central, and a strand is attached to each. The whirls are then put in motion, but in opposite directions, and this causes the outer strands to be laid with great regularity and firmness around the central one. Such is the ordinary process of rope-making; but machines have been invented which produce ropes with such mathematical precision that the strength of the rope may be calculated with great exactness. Captain Huddart has the merit of effecting these improvements; and very few applications of mechanism are more beautiful in their details than those which he has worked out. They, however, do not alter the principle of the manufacture. Within the last few years a great improvement has been patented by Mr. Edward Sang of Edinburgh, and is now in profitable use in the large establishment of the Edinburgh and Leith Ropery company. It consists of a machine which spins the yarn from material supplied as before by hand, but it does away with the long walk, and can be used in a small room.

Large ropes are either what is called *cable-laid* or *hawser-laid*. The former consist of three large strands, each made up of three smaller strands. A cable-laid rope of eight inches' circumference is made up in this way of nine strands, each containing 37 original yarns, or altogether 333 yarns. A hawser-laid rope consists of only three strands, each containing a sufficient number of yarns to make up the required thickness. The numerous lives and the vast property depending on the efficiency of ropes employed in shipping have caused a great amount of ingenuity and care to be brought to bear on the manufacture. One very great improvement of modern times has been the introduction of wire ropes, which are now extensively used in rigging ships, and for other purposes. They are generally made of iron wire, sometimes but not always galvanized. The twisting is effected in the same way as that in which the strands of a hempen rope are laid together.

ROQUE, SAINT, a popular saint of the Roman Catholic church in France, who is especially considered the patron of those sick of the plague. Of his history, nevertheless, few particulars have been preserved. He was born of a noble family in Montpellier, early in the 14th, or at the end of the 13th c.; and having undertaken a pilgrimage to Rome, was surprised, upon his way through Italy, by an outbreak of the plague at Piacenza, where he devoted himself with generous zeal to the care of the victims of this pestilence. Falling sick of the plague himself, and abandoned by man, he contrived to drag himself to a neighboring wood, where a dog used to lick his sores; and it pleased God to restore him to health. He returned to France; and, after a life of great sanctity, died at Montpellier, probably in 1327.

ROQUEPLAN, JOSEPH ÉTIENNE CAMILLE, 1802-55; a French painter who commenced to exhibit in the French salon in 1822, and whose charming style at once fixed his high rank. In 1827 the "Marée d'Equinoxe," afterward engraved by Gelée, and illustrations of Walter Scott's works, gave him an English reputation. The "Amateur Antiquary," painted in 1854, sold in 1853 for 30,000 francs. Theophile Gautier ranks him as one of the most admirable of all French painters, of a school of exquisite finish and truth to nature, much followed since his time. His latest work was "Filles d'Ève."

ROREE, RORI, or LOIRI, a decayed t. of Sinde, stands on a picturesque rocky eminence, on the e. bank of the Indus, in lat 27° 38' north. Steamers ply to and from Hyderabad. Cotton and silk fabrics, gold and silver wares, paper, and leather are manufactured. Pop. '72, 8,580.

RORIC FIGURES, images produced by breathing on glass or other polished surfaces which have been covered by some object. Dr. J. W. Draper, in 1840, called attention to the subject in the *Philosophical Magazine*. Möser of Königsberg, in 1842, made a communication to the French academy through M. Regnault, in which he stated that, when two bodies are very near each other, they receive impressions of each other's images, or, if a smooth surface has been touched by another body, it acquires the property of precipitating vapors, which, by their action, cause an impression which gives to

the surface a different appearance. These roric figures are often called by the Germans *hauchfiguren*, or breath figures. Mr. Grove has called them molecular impressions. Mr. Hunt has produced similar effects by heat. He placed gold, silver, and bronze coins and medals on a polished heated copper-plate. After cooling he removed the coins, etc., and exposed the plate to the vapor of mercury. The parts which had been covered by gold and silver coins gave the most distinct impressions, the gold more than the silver. Bregnet, a French watchmaker, found markings on the exterior of the inner case of a watch reproduced inversely on the inner surface of the outer case. Phenomena of this kind have been observed by thousands, but the explanations vary, as probably do the causes; there sometimes being a transfer of matter from one body to the other, and sometimes a molecular change in the surface in consequence of its having been for some time exposed to different external circumstances. There is always a molecular change taking place on the surfaces of all bodies; the very constitution of matter necessitates it. The molecules of all matter are in a constant state of vibration; often there is a loss of substance in consequence of such vibration; but when there is no loss there is necessarily some change in the surface, and this change will vary with the material by which the surface is covered. A gold coin will exert a different impression from a silver one, or from a steel, iron, or bronze object; and a woolen or silk fabric will produce a still different effect. The surfaces of all these objects are constantly throwing off, it may be infinitesimal, particles of matter, and the mutual action between two surfaces must vary with the relative properties of those surfaces. The surface of a piece of polished steel or silver will change more rapidly in a heated than in a cool room, other circumstances being the same; and also faster in a light than in a dark room. The kinematic energy of the surface, and therefore its change, will vary with circumstances.

RORQUAL, *Rorqualus*, *Balanoptera*, or *Physalus*, a genus of cetacea of the same family (*balenidae*) to which the Greenland whale belongs, and distinguished by having a dorsal fin, which, however, is not large in comparison with the size of the animal, and is pointed, the point directed backward; and also by the form of the head, which, instead of having the upper jaw much arched, as in the Greenland whale, has it in the skeleton nearly straight, the plates of baleen or whalebone being, therefore, much shorter, while along the throat and belly are many longitudinal folds, allowing of the distention of the integuments so as to form a great pouch for the reception of water and prey, to be afterward sifted by the plates of baleen. For a long time these folds of the throat and belly were a puzzle to naturalists, but their use seems now to be thoroughly ascertained. The form is more elongated than in the Greenland whale, and as the girth of the largest rorquals has been found equal to that of the largest Greenland whales, the rorquals appear to be the largest of the cetacea, and indeed of all animals at present existing in the world. The northern rorqual sometimes rather exceeds 100 ft. in length. Concerning the species of this genus, there is great doubt and uncertainty. Some naturalists confidently assert the existence of several species in the northern seas, and a genus, *rorqualus* or *physalus*, has been constituted distinct from *balanoptera*, the largest species being referred to the former; and a smaller one, said not to exceed 25 ft. in length, and known as the *pike whale*, from the resemblance of the mouth to that of a pike, being assigned to the latter. Other naturalists of no mean reputation doubt if the pike whale (*balanoptera rostrata* or *B. musculus*) is anything else than the young of the great northern rorqual (*R. boops*), the *fin-fish* or *razor-back* of whalers. The question was supposed to have been determined by Mr. F. Knox of Edinburgh, who found the number of vertebrae to be different in specimens cast upon the Scottish shores; but the number of vertebrae has been found so different in other specimens examined that either this must be a comparatively unimportant character, or the number of species must be greater than has been supposed. The northern rorqual is of a slate-gray color, whitish beneath. It is found in the arctic seas, visiting also those of the northern temperate regions, and is not very unfrequent on the coasts of Britain. When it comes to the surface of the water to blow, it does not lie motionless, as the Greenland whale usually does, but swims at the rate of about five miles an hour, and in blowing, it makes a prodigious noise. Its speed, when harpooned, is very great. Scoresby mentions an instance of one carrying out 3,000 ft. of line in a minute. It is not easily captured; and whalers dislike it, because the Greenland whale is seldom found near it, while its own value is very inferior, owing to the comparative thinness of the blubber, and the shortness and inferior quality of the whalebone. It is, however, an important object of pursuit to the Laplanders and Greenlanders, who wear it out by assailing it with weapon after weapon, and finally divide the spoil. A large rorqual yields 4,000 gallons of oil.—The rorqual does not feed so exclusively on small prey—acalephæ, mollusks, etc.—as the Greenland whale. Its gullet is much wider, and it preys much on fishes; the shoals of which it follows into bays and estuaries, devouring them in multitudes. The stomach of a rorqual has been found to contain 600 large cod, and a great quantity of pilchards. One which frequented the firth of Forth for 20 years was well known to the fishermen there, and much detested by them. It was at last stranded at Abercorn in 1692. It was 78 ft. long.—In the southern seas, another species of rorqual is found (*R.*, *B.*, or *P. Australis*), which has a long dorsal fin, placed further forward than in the

northern orqual. It attains a large size. The South sea whalers do not care to pursue it. Its range seems to extend to the northern hemisphere in the Pacific.

ROSA, EUPHROSYNÉ PAREPA, 1836-74; b. Edinburgh; daughter of Georgiades de Boyescu, a Wallachian nobleman, and Elizabeth Seguin. She studied under Crescentini, Panzeron, and Bordogni, and made her first appearance as a singer at Malta under the name of Parepa. She made her *début* in London in 1857, and in 1863 married capt. Carvell, who died two years later. She then came to America and appeared at Irving hall, New York, in 1865. In 1867 she married Carl Rosa, the violinist, with whom in 1869 she organized an English opera company, which performed in all the larger cities of the United States. She sang at the Boston peace jubilee in 1869, and was a member of the Italian opera company at the Khedive's theater in Cairo during the winter of 1872-73.

ROSA, SAINT, 1586-1617; b. Lima, Peru; the only American saint in the calendar of the Roman Catholic church. Her parents were originally wealthy; but, having lost their property, were supported by the toil of their daughter, who became a Dominican recluse. The canonization of St. Rosa was in 1671 by Clement X.

ROSA, SALVATOR, was b. at Renella, in the neighborhood of Naples, in 1615. His first instructor was Francesco Francanziani, who had married his sister. Some of his landscapes attracted the notice of Lanfranco, who, purchasing them, enabled and encouraged the young artist to pursue his studies. He became a pupil of Aniello Falcone, a painter of battle-pieces, and afterward of Spagnoletto. Having gone to Rome he was employed to paint an altar-piece and some other works by the Neapolitan cardinal Brancacci, and he accompanied prince Carlo de' Medici to Florence, and executed several important works for him. He finally settled in Rome in 1638, and died there, Mar. 15, 1673. Salvator has a great reputation as a painter, and he owes this mainly to his landscapes, which, though faulty in many respects, arrest attention by originality in subject and treatment, being generally representations of wild and savage scenes, executed with a freedom and decision remarkably appropriate. Salvator executed numerous etchings, highly characteristic of his peculiar style.

ROSA'CEA, known also as **GUTTA ROSEA** and **ACNE ROSACEA**, is a disease which usually first appears at or near the end of the nose; and in some cases it is confined to the nose, while in others it extends to the cheeks, forehead, chin, or even to the whole face. The skin in the part affected assumes a deep red color, which usually disappears after a time, but returns either on no special provocation, or in consequence, apparently of some gastric disturbance, and after a time becomes permanent; pustules of acne—a chronic pustular disease of the skin—now appear, and their yellowness contrasts strongly with the redness with which they are surrounded. The skin of the diseased part becomes irregularly swollen, and is marked with blue or red streaks, caused by congestion and enlargement of the capillaries; the whole surface, in a severe case, presenting a very disagreeable and repulsive appearance. This affection is no doubt often a result of intemperate living, but it may occur in persons of regular habits of life. Disorder of the digestive system is so often associated with it as to exclude the idea that the combination is accidental, and the skin disease may often with great probability be referred to gastric disturbance as the exciting cause. The disease is confined almost exclusively to persons in middle or advanced life, and women are especially liable to it about the period in which what is popularly known as the "change of life" occurs; moreover, it has occasionally been observed to be hereditary. The general treatment consists in the administration of the compounds of iodine and mercury (singly or conjoined) in alterative doses, and Donovan's solution has been especially recommended; and a nourishing but bland and non-stimulating diet should be prescribed. In the early stages of the disease the local treatment should be soothing. Emollient lotions, such as emulsion of bitter almonds, cream, glycerine, &c., may be occasionally used during the day, and in severe cases a bread poultice may be applied to the face at night. When the affection becomes indolent the emollients should be gradually replaced by stimulating applications, such as Eau de Cologne, or a solution of corrosive sublimate in alcohol, in the proportion of from 1 to 2 grains in the pint; and at a still later stage iodide of sulphur ointment, in the proportion of 15 grains, or a scruple of the iodide to an ounce of lard, is well deserving of a trial. When the disease is of long standing it sometimes defies all known remedies.

ROSACEÆ, a natural order of exogenous plants, containing many species of great usefulness, and many that are in the highest esteem for their beauty. It contains trees, shrubs, and herbaceous plants, natives chiefly of cold and temperate regions, and far more abundant in the northern than in the southern hemisphere. Within the tropics they are chiefly but not exclusively found in elevated situations. The leaves are alternate, have stipules, and are either simple or compound. The flowers are generally hermaphrodite, but sometimes unisexual; the inflorescence various. The calyx is 4 or 5 lobed, generally 5 lobed; the petals as many as the divisions of the calyx, or occasionally wanting, perigynous. The stamens are few or many, arising from the throat of the calyx; the ovary sometimes solitary, sometimes there are several ovaries; each one-celled, with a lateral style; or a number of ovaries are united into a many-celled pistil;

the ovules generally two or more. The fruit is sometimes a drupe; sometimes a pome; sometimes follicular; sometimes an achænum; sometimes a heap of achænia, or of one-seeded berries; sometimes a heap of achænia, covered with the fleshy tube of the calyx.—This natural order contains at least 1000 known species; but in some of the genera, as *rosa* and *rubus*, the determination of the species is attended with great difficulty, and varieties—sometimes reckoned species—are numerous.—The order, as generally received, is divided into a number of suborders, several of which have by some botanists been elevated to the rank of distinct orders, as *amygdalææ*, *poniceæ*, *sanguisorbææ*. See also ROSE, RUBUS, STRAWBERRY, POTENTILLA, TORMENTIL, AGRIMONY, GEUM, SPIRÆA, CUSSO, etc.

ROSAMOND, usually called Fair Rosamond; daughter of Walter, lord Clifford. She was the favorite mistress of Henry II., who is reported to have secreted her in a labyrinth at his palace of Woodstock, where, according to some writers, she was discovered and poisoned by the queen Eleanor. This story is not supported by history, and it is more probable that she died in the nunnery of Godstow, in Oxfordshire, about 1173. Her two sons by Henry II. were William Longsword, earl of Salisbury, and Geoffrey, bishop of Lincoln. She was buried in the church of Godstow, opposite to the high altar, where her body remained till it was ordered to be removed, by Hugh, bishop of Lincoln, in 1191.

ROSA, MONTE. See MONTE ROSA, *ante*.

ROSA RIO, a t. of the Argentine Republic, on the right bank of the Parana, 170 m. n.w. from Buenos Ayres, 210 m. by river. It is the most important town on the Parana, and is rapidly increasing in population and commerce. The customs duties amount to considerably over £140,000 a year. In 1874 the value of merchandise imported direct was \$7,046,400; of the exports, \$2,101,100, of which \$1,073,540 consisted of wool, hides, etc., sent to the United States. Pop. above 40,000.

ROSARY OF THE BLESSED VIRGIN MARY (Lat. *rosarium*, a chaplet of roses), the name given to a very popular form of prayer in the Roman Catholic church. The name rosary has been variously traced either to the title "Mystical Rose," one of the titles under which the Blessed Virgin is addressed in the litany of Loretto (q.v.), or to St. Rosalia's wreath of roses, well known in sacred art, or to the beads being originally made commonly of rosewood. The origin of the devotion itself is popularly traced to St. Dominick (q.v.); but it is quite certain that its characteristic feature, the use of beads as a means of reckoning the number of repetitions of a certain prayer, is of far greater antiquity. See BEADS. Palladius tells of the abbot Paul, whose daily practice it was to repeat the Paternoster 300 times, that he used a number of small pebbles to secure a correct enumeration, dropping one of these into his lap at each repetition. Later, a string of beads, worn round the neck, and called *beñidum*, was substituted. As the same use of beads exists among the Mohammedans, some writers have traced the Roman Catholic practice to a Mohammedan origin; but it appears quite certain that the practice existed among Christians before the time of Mohammed. Originally, the prayer so repeated was the Lord's Prayer; but when, in the 11th and 12th centuries, the so-called angelical salutation, "Hail, Mary!" etc., became a frequent form of prayer, it was added to the "Our Father;" and it seems beyond all doubt that the rosary in its present form was, if not devised, at least fully introduced and propagated by St. Dominick. The rosary, although called of the Blessed Virgin Mary, is a series of fifteen prayers, founded on the chief mysteries of the incarnation and passion of our Lord, interspersed with repetitions of the "Our Father," the "Hail, Mary!" and the doxology. It consists of three parts, each of which contains five so-called mysteries, connected with our Lord's incarnation and public mission on earth, his passion and death, his resurrection and ascension, and the assumption of the Blessed Virgin Mary. Each of these parts thus contains five mysteries (called also "decades" from the ten "Hail, Mariés") consisting of (1) a "meditation," briefly proposing the mystery which is to be meditated upon; (2) one "Our Father;" (3) two "Hail, Mariés;" (4) one doxology; (5) a prayer begging for the special grace or fruit appropriate to the particular mystery. The whole rosary, therefore, consists of 15 mysteries or decades, and thus comprises 15 "Our Fathers" and "Doxologies," and 150 "Hail, Mariés." The devotion of the rosary takes several forms. The "Greater Rosary" consists of the recitation of the whole fifteen mysteries or decades, with their component prayers. The "Lesser Rosary" consists of one of the three parts, or of five mysteries or decades. The "Living Rosary" is recited by an association of fifteen individuals, each of whom engages to say daily one mystery. When recited publicly, the prayers are repeated alternately by the priest or other person presiding at prayer, and by the congregation. There is a form of the rosary common in foreign countries, especially Germany, in which the substance of each "mystery" is condensed into a short prayer of three or four words, which are appended to the "Hail, Mary!" and thus serve perpetually to recall the subject to the mind of the person praying vocally. The rosary has been sanctioned and recommended by numberless popes and other ecclesiastical authorities, and indulgences (q.v.) have been granted to persons reciting it with proper dispositions. It is regarded by Roman Catholics as one of their most excellent forms of prayer, and as placing the devotion to the Blessed Virgin Mary on its true footing—that of a devotion to the incarnation and death of her Son, Jesus

Christ. It is expressly recommended for the poor and the ignorant; and there are instructions specially designed for these classes, in order to enable them to combine prayer of the mind with prayer of the lips.

The mechanical instrument, so to speak, of this devotion is also called by the name rosary. It consists of a string of beads, equal in number to the "Our Fathers" and "Hail, Maries" which are recited in the rosary—the "Our Father" beads being of a larger size—one of which is passed through the fingers at each recitation of the prayer, and thus secures the person praying from errors of memory. The beads are of various material—berries, wood, stone, ivory, metal, etc., and are often of costly workmanship, and of considerable intrinsic value. They are blessed for the use of the people by the pope, by bishops and superiors of religious orders, and by others having special power for the purpose.

ROSAS, DON JUAN MANUEL, president of the Argentine Confederation, b. at Buenos Ayres in 1793, descended from an ancient family of the Asturias. He entered the army of Buenos Ayres, and in 1829 rose to be governor or capt.gen. of his native province, then in federal union with Entre Rios, Corrientes, and Santa Fé. He showed great courage and capacity in subduing the disaffected Indians, and internal peace being thus secured, he turned his attention to the state of the confederation, which, in 1835, was falling to pieces by the feebleness of its governments. A single president was, upon his recommendation, elected for the whole Argentine Confederation, and the choice fell upon Rosas. His residence was to be Buenos Ayres, and to this state were intrusted the external relations of the confederation, and the management of the more important functions of the executive. Intestine commotion subsided under his rule, the industrial resources of the country were developed, and foreign commerce rapidly increased. The other states, however, became jealous of the growth and power of Buenos Ayres, and Rosas was accused of a design to extend and uphold the undue predominance of his state, and to give his native city a monopoly of the trade of the river Plate. In the execution of this design, he sought to compel Paraguay to join the confederation. This involved Rosas in a war with Brazil, in which his troops were outnumbered, yet he obstinately kept up the struggle for five years. An attack on Montevideo was also rendered necessary by his policy; but England and France interfering for the protection of that city, Rosas was again defeated; yet he managed to resist the allied forces from 1845 to 1850. His rule had by this time become so oppressive and intolerable that the subject states revolted, and selected don J. J. Urquiza as their president and general. A battle ensued at Monte-Caseros, Feb. 3, 1852, when Rosas's forces were put to flight. Urquiza entered Buenos Ayres as president of the confederation; and Rosas, who was compelled to flee, obtained a refuge in England, in which country he for the most part resided till his death in March, 1877.

ROSCIUS, QUINTUS, was b. at Solonium, a village near Lanuvium, and rose to be the greatest comic actor in Rome. So much was he admired that many of the Roman aristocracy befriended him, and the dictator Sulla, as a token of favor, presented him with a gold ring, the symbol of the equestrian order. Among his most admiring and affectionate patrons, Roscius also numbered Cicero, who, at the commencement of his career, received lessons in the art of elocution from the great comedian, and even in later life used to make trials of skill with his instructor as to which of them rendered a thought most clearly and effectively—the orator by his diction, or the comedian by his gesticulation. So sensible was Roscius of the distinction he enjoyed in sharing the intimacy, and even the friendly emulation of the great orator, that he came to look upon his art as one of no small importance and dignity, and wrote a treatise on the comparative methods and merits of eloquence and acting. Cicero's friendship was of use to him in another way, for on his being sued at law by C. Fannius Chærea for the sum of 50,000 sesterces, Cicero defended him before the judex Piso (probably 68 B.C.) in his extant oration *Pro Q. Roscio Comædo*. He died 62 B.C., having attained such perfection in his peculiar art that to be a "Roscius" became synonymous with pre-eminence in every profession, and leaving, like his famous contemporary, Æsopus the tragedian, an immense fortune, realized upon the stage.

ROSCOE, HENRY ENFIELD, b. London, 1833; educated at University college, London, and at Heidelberg, where, in association with Bunsen, he published several memoirs on chemical subjects. He has been professor of chemistry in Owens college, Manchester, since 1857. Among his works are *Elementary Lessons in Chemistry*, 1866; and *Lectures on Spectrum Analysis*, 1867. He was associate editor with Huxley and Balfour Stewart of Macmillan's *Science Primer*.

ROSCOE, WILLIAM, the eminent historian of Lorenzo de' Medici and Leo X., was b. near Liverpool on March 8, 1753. His father was a market-gardener, whose assistant in this business he became in his twelfth year, after receiving the rudiments of learning at a common school. In this occupation he continued for about three years, during which his fondness for reading developed itself; and in 1769, after making trial for a year of a book-seller's shop, he was articled to an attorney at Liverpool, where, in 1774, being admitted an attorney of the court of king's bench, he began to practice on his own account. During all this period he assiduously cultivated his mental powers, turning his attention to the classics, and especially to the Italian language and literature. In 1773

he first appeared in print as the author of a poem; and in 1777 a collection of some of his earlier pieces was published, containing his first protest against the slave-trade, of which, throughout his life, he was a strenuous opponent. In 1793 was published the first volume of his *Life of Lorenzo de' Medici, called the Magnificent*, which had been begun many years before, and in the composition of which he was greatly aided by the collection for him of valuable materials in Italy, from sources in print and manuscript, by his friend Mr. Clarke. The success of this work was extraordinary, and it at once established his literary reputation. The work was received with the highest approbation by those who were best able to appreciate its merits, both in England and on the continent, especially in Italy; it went through several editions, and was translated into German, French, and Italian. In 1805 appeared his second great work, the *Life and Pontificate of Leo X.*, for which, with the assistance of others, he had been collecting materials for many years. This work also, which, like the former, appeared successively in German, French, and Italian, was received with much commendation by the most impartial judges, though its tone and spirit, especially with reference to the reformation, was severely criticised by others.

Roscoe at one time had thoughts of adopting the bar as a profession; but about the year 1800, he became partner in a Liverpool bank, a step which involved him eventually in great pecuniary embarrassment. In 1806 he was returned to parliament for Liverpool in the whig interest, and had the gratification of taking part in the abolition of the slave-trade, but did not again come forward after the dissolution in 1807. He was, throughout, a consistent opponent of the war with France, against which he published several pamphlets, and was on all points the advocate of liberal opinions. He took an active part in founding the Liverpool royal institution, and was a zealous promoter of literature, and patron of the fine arts. Roscoe died at Liverpool, June 30, 1831. During the latter years of his life, he devoted himself much to the study of botany, and in honor of him a rare genus of monandrian plants received in 1826 the name *Roscoea*.

ROSCOMMON, a co. in n.e. Michigan, crossed by the Jackson, Lansing and Saginaw railroad; drained by the s. branch of the Au Sable, and by the Muskegon and Titibawassee rivers; 576 sq. m.; pop. '80, 1459. The surface is uneven and nearly covered with forests, principally of pine trees; the soil is poor. It has many lakes, the largest of which are Higgins's and Houghton's, the latter being 11 m. long. Co. seat, Roscommon.

ROSCOMMON, an inland co. of Ireland, in the e. of the province of Connaught, and bounded on the e. by the river Shannon, is 60 m. long from n. to s., by 40 m. from e. to west. Area, 607,691 acres, of which 440,522 are arable. Pop. '71, 140,670. 737 persons speak Irish only. Number of pupils on the roll of the national schools in Dec., 1875, 32,654 (of whom 32,186 were Roman Catholics). Number of emigrants from Roscommon between 1851 and 1871, 52,299. The surface of Roscommon, which belongs to the central plains of Ireland, is level, with undulations rising in the s. into the Slieve Bawn range, the highest point of which is 867 ft. in height; and on the n., into the Curlew mountains, of which Slieve Curkagh attains a height of 1098 feet. Its principal rivers are the Shannon (q.v.) and the Suck. Roscommon communicates by means of the Midland Great Western, and the Southern and Western, and Northwestern railways, with all the extremities of the kingdom. In geological structure it belongs to the central limestone formation, in some districts of which the sandstone protrudes. The soil in the central district is in general light, but fertile, and affords the finest sheep-pasture in Ireland—the celebrated "plain of Boyle." Some portions also contain a rich and fertile loam, which produces good cereal crops; but the chief industry of the Roscommon farming population is the feeding of sheep and cattle, especially the former.—The county can hardly be said to possess any manufacture worthy of mention. The chief towns are Roscommon (q.v.), Boyle, Castlerea, Elphin, Strokestown. Ballinasloe and Athlone lie upon the border, and are partly within this county. Roscommon, in the ante-English period, was the country of the sept of MacDermot, O'Daly, O'Kelly, and above all, O'Connor, of which there were two branches, that of the O'Connor Roe (red), and that of O'Connor Don or Dhun (brown). The present representative of the O'Connors, the O'Connor Don, is one of the very few Irish princes who have succeeded to the hereditary estates of their ancestors.

Roscommon sends two members to the imperial parliament. It possesses a vast number of antiquities of the Celtic period, raths, etc.; a portion of a round tower at Oran, several remains of strong castles of the English period, and some fine ecclesiastical ruins, of which Boyle, Roscommon, Tusk, and Clonslanville are the principal.

ROSCOMMON, the capital and assize t. of the co. of the same name, Ireland, in the middle of the county, 96 m. w. by n. from Dublin. The pop. in '61, was 2,699; in '71., 2,375. Of the inhabitants less than 300 are Protestants. Roscommon dates from the 13th c., when it arose around a Dominican abbey, founded by the O'Connor in 1257, and a castle built soon after by sir Robert de Ufford, the remains of both of which structures still exist. Roscommon is a market-town, in which corn is the principal commodity. It has scarcely any manufacture, and little commercial enterprise of any kind. It returned two members to the Irish parliament, but was disfranchised at the union. Two newspapers are published here.

ROSCOMMON, WENTWORTH DILLON, Earl of, 1634-84; b. Ireland; nephew of the earl of Strafford; retired to the continent after the impeachment of his uncle. After the restoration he held various court positions, married a daughter of the earl of Burlington, and devoted himself to literature. He wrote an *Essay on Translated Verse; Horace's Art of Poetry Translated into English Blank Verse*, and a collection of prologues and epilogues to plays. He was buried in Westminster abbey.

ROSCREA, a market t. of the co. of Tipperary, Ireland, 94 m. s.w. by w. from Dublin, with which it is connected by a branch from the Great Southern and Western railway. The pop. in 1861 was 3,543; in 1871, 2,992. Of this number 470 were Protestants of the Episcopal church. Roscrea is a very ancient town, dating back to the early Christian period, when a monastery was built upon this site in the beginning of the 7th century. The modern town is tolerably well-built; the Roman Catholic church is a handsome structure; and there are considerable remains of the ancient greatness of the place—a castle, a lofty round tower 80 ft. high, and ruins of two abbeys. The only manufacture is coarse woolen cloth, but there is a considerable market for agricultural produce. There are several schools, some with endowments of ancient date.

ROSE, *Rosa*, a genus of plants of the natural order *rosacea*, consisting of shrubs, generally with prickly stems and pinnate leaves, the leaves terminating in a single leaflet; stipules at the base of the leaf-stalks; the calyx 5-fid, its tube contracted at the summit, and finally becoming fleshy, and forming a chief part of the fruit; the corolla of five petals; the stamens numerous; the styles springing from the narrowed throat of the calyx, free, or aggregated into a column. The flowers are generally of the red tint well known as *rose-color*, but sometimes white, more rarely yellow, and sometimes striped. The fruit (*hip* or *hep*) consists of the enlarged and colored tube of the calyx, within which are contained many *achenia* (q.v.) amid prickly hairs. The species are very numerous, even after allowance has been made for a great number of varieties elevated into species. There is no genus of plants in which the limits of species are more difficult to define, or in which varieties are more apt to be regarded as species. In Withering's *British Botany*, published near the end of last century, only five British species of rose are given; in Hooker and Arnott's *British Flora*, 19 species are recognized, while many forms, reckoned as species by some botanists, are noticed as mere varieties. Roses are natives of all the temperate parts of the northern hemisphere, and of its colder regions, even to Lapland and Hudson's bay. They have long been among the chief favorites in flower-gardens for the beauty and fragrance of their flowers; and, more than any other flower, emblems of everything beautiful and delightful. Countless varieties—single and double—have been produced by cultivation, which it is often extremely difficult to refer to their original species.—Among the ancients the rose was sacred to Eros or Cupid, and Aphrodite or Venus, and was accounted the emblem of joy and love, and at the same time of prudence. Its opening buds are a favorite poetic image of innocence and purity.—Among the roses best known to the ancients was the HUNDRED-LEAVED ROSE (*R. centifolia*), excelled by no other species in beauty and fragrance. It is a native of the Caucasus, and has been cultivated in gardens from very ancient times. Among its numberless varieties are the Moss Rose, the calyx of which sends forth branching excrescences, so that it seems overgrown with moss, the flower—which is only known as a double rose—being exquisitely beautiful and fragrant; the PROVENCE or CABBAGE ROSE, one of the most common, and also one of the finest roses; the small-flowered BURGUNDY ROSE, etc.—The FRENCH ROSE (*R. Gallica*) is a native of the s. of Europe. Many varieties of it are cultivated, particularly very beautiful double ones. It is distinguished by its hard leaves, which have a peculiar dryness, and its much expanded petals. It has a fainter smell than *R. centifolia*, but its petals are more astringent, and are preferred for the preparation of *vinegar of roses* and *conserve of roses*.—The DAMASCUS or DAMASK ROSE (*R. Damascena*), a native of Syria, is much cultivated, and is sometimes called the MONTHLY ROSE, which name, however, is more frequently given to the China rose.—The MUSK ROSE (*R. moschata*) is a native of the n. of Africa and the s. of Spain. Its flowers have a strong and delightful fragrance; they are white, and disposed in rich corymbs. It has been cultivated in England since the end of the 16th century.—The DOG ROSE (*R. canina*) is common in Britain and throughout Europe, also in the n. of Asia, growing in thickets and hedges. It varies, even in a wild state, in the color of its flowers, which are red, pale, or white. It has long straight shoots, which are often used as stocks for ornamental rose-trees, other kinds of rose being budded upon them. The bark of the root was formerly esteemed of peculiar virtue in preventing fatal consequences from the bite of a mad dog; whence the name of the species.—The VILLOUS ROSE (*R. villosa*), another common British species, has the fruit larger and more fleshy than the dog rose. The leaves are downy.—The FIELD ROSE (*R. arvensis*) is common in many parts of Britain, in woods and hedges. It has white flowers. It is remarkable for its trailing habit and long climbing or pendulous twigs, on account of which it is frequently planted and trained to cover walls and trellises. It is often called the AYNSHIRE ROSE, although that name is shared by another kind of similar habit, which is regarded as a deciduous variety of the EVERGREEN ROSE (*R. sempervirens*), a native of the s. of Europe. These often make shoots of 20 ft. in a season. Of the same habit also is the MANY-FLOWERED ROSE (*R. multiflora*), a native of

China and Japan, a very fine species, but not sufficiently hardy for the colder parts of Britain.—Very different in habit is the SCOTCH ROSE, or BURNET-LEAVED ROSE (*R. spinosissima*), a species common on heaths, sands, and chalk downs, in many parts of Britain; a low compact bush, with very small leaves and flowers. It is occasionally found in infertile situations, so dwarfed in size as not to measure more than 3 in. from the very tip of the root to the center of the flower (which is undiminished in size). Many fine double varieties are now in cultivation.—The ALPINE ROSE (*R. Alpina*) is a beautiful ornament of the Alps and of other mountains of central Europe, remarkable for its flower-stalks bending down in an arch after flowering.—The SWEET BRIER ROSE (*R. rubiginosa*) is a bushy species, with small leaves and flowers, a native of Britain, but more common in some parts of continental Europe, growing in open bushy places, and remarkable for the sweet balsamic smell of its leaves, on account of which it is much planted in hedges and shrubberies. A kindred species (*R. suaveolens*) is found in North America.—The YELLOW ROSE (*R. lutea*), a native of Germany, is chiefly remarkable for the color of its flowers, which, however, have a disagreeable bug-like odor. A fine variety is much cultivated, with petals yellow externally, and bright red on the inside.—The INDIAN ROSE, or CHINA ROSE (*R. Indica*), is a native of China, was thence carried to India, and is now also common in Europe, being a hardy plant which does not suffer from the frosts of winter in any part of Britain, although it was at first introduced as a green-house plant. It is one of the most important additions recently made to our flower-gardens and shrubberies; flowering not only in the middle of summer, with the other roses, but throughout the year, even in winter, when the weather is mild. It is now very common throughout Europe. The name MONTHLY ROSE is often given to it from a notion that it flowers every month. The NOISSETTE ROSE, remarkable for its extremely rich corymbs, and the TEA ROSE, of which the dried leaves have a fine fragrance, and are said to be used in China for flavoring tea, are regarded as varieties of it. The odor of the flower is much fainter than that of many other roses; and the bush is never large.

Some kinds of rose, as the China rose, are easily propagated by cuttings, the other kinds by layers. The finer varieties are budded on stocks of some common kind. Many of the kinds require much pruning and attention of the gardener. The old shoots are cut out, and the young wood thinned and shortened. The flowering of a rose-bush may be retarded by cutting it closely down late in spring, and it will blossom when other roses have disappeared. Roses grow well in all ordinary soils, but are very sensitive to atmospheric influences, and do not succeed amid the smoke of towns.

The genus *lutea* has been separated from *rosa* by Lindley, chiefly on account of the simple leaves. The only known species is a native of central Asia.

The fruit of roses is used in medicine. See HIP. A mildly astringent and agreeable syrup, and other preparations, are made from the rapidly dried petals and buds of the French rose. A syrup is similarly made from the petals of the hundred-leaved rose; and water distilled from them, *rose water*, is employed for various purposes on account of its agreeable odor. *Rose vinegar*, made by steeping rose petals in vinegar, is useful as an external application in headaches, for dissipating unpleasant smells in apartments, etc. *Conserve of roses* is made of the petals of roses pounded with sugar, and is useful as an astringent in diarrhea of children. Oil or attar (q.v.) of roses is one of the most valuable of perfumes.

Rose-bushes are often much injured by a species of aphid (*A. rosa*), a small green insect, which swarms upon the leaves. A reddish fungus, *puccinia rosea*, often covers the leaves in the latter part of summer.

ROSE, in heraldry. The heraldic rose is drawn in a conventional form, and never with a stalk, except when expressly directed by the words of blazon. Being sometimes argent and sometimes gules, it cannot be designated proper; but when blazoned "barbed and seeded proper," it is meant that the barbs are to be green, and the seeds gold or yellow. The rose gules was the badge of the Plantagenets of the house of Lancaster, and the rose argent of that of York. The York rose was sometimes surrounded with rays as of the sun, and termed *rose en soleil*. As a mark of cadency, the rose has been used as the difference of the seventh son.

ROSE, THE, a popular name for erysipelas (q.v.), which is also known as St. Anthony's fire, *Ignis Sacer*, etc.

ROSE, HENRY JOHN, 1801-73; graduated at St. John's college, Cambridge, in 1821; became fellow in 1824; Hulsean lecturer in 1833; rector of Hough' on Conquest, Bedfordshire, in 1837; archdeacon of Bedford in 1866. He edited the *Encyclopædia Metropolitana*; translated Neander's *History of the Christian Religion and the Church during the First Three Centuries*, 2 vols.; and was one of the authors of the *Speaker's Commentary*. He published *The Law of Moses*, etc.; *History of the Christian Church*.

ROSE, HUGH JAMES, 1795-1838; b. England; educated at Trinity college, Cambridge; ordained deacon; and became in 1818 curate of Uckfield, Surrey, and in 1821 of Horsham, Surrey; in 1825 select preacher at Cambridge; in 1826 chaplain to bishop Howley, and prebendary of Chichester, 1827-33; rector of Hadleigh, Suffolk, in 1830, and of Fairstead and Werley in 1833, soon leaving the last for St. Thomas, Southwark. In 1833 he was made professor of divinity of the university of Dublin; in 1834 chaplain

to the archbishop of Canterbury; in 1836 principal of King's college, London. He published *Christianity Always Progressive*; *Notices of the Mosaic Law*; *The Gospel an Abiding System*; and an edition of Parkhurst's *Greek Lexicon*.

ROSE ACACIA. See ROBINIA.

ROSE APPLE. See EUGENIA.

ROSE BEETLE, *Cetonia aurata*, a coleopterous insect of the section *pentamera*, of the tribe *lunellicornes*, and not distantly allied to cockchafers and to the true beetles, or *scarabæi*. It is a common British insect, about 1 in. long, of a shining green above, coppery red underneath, with white marks on the elytra. In its perfect state it frequents flowers, particularly the rose; in its larva state it inhabits rotten timber, the roots of vines, etc., and is often found in ants' nests, apparently feeding on the small particles of wood which the ants have collected. It remains about three years in the larva state, makes a cocoon of particles of wood, glued together by an excretion of its own; passes the winter as an inactive pupa, and appears in summer in its perfect form. It flies well, with a sort of humming noise, from flower to flower, feeding on honey, and, in order to reach it, devouring the nectaries.—In North America the name rose beetle is given to another coleopterous insect of the tribe *clavicornes*, about one-third of an inch in length. It is very injurious to gardens and nurseries in North America, its ravages extending to many plants besides the rose. These insects often appear suddenly in swarms, and disappear as suddenly.

ROSE-BUG, *Melontha subspinosa*, a coleopterous insect about $\frac{1}{2}$ of an inch long, buff yellow color on the back, and white beneath. It has been known in New England between 50 and 60 years. It emerges from the ground about the second week in June, appearing in swarms, remaining a little over a month. The males then die and the females re-enter the earth, lay their eggs, and come again to the surface and die. The eggs, which are about one-thirtieth of an inch in diameter, hatch in about 20 days, when the larvæ commence to feed upon tender roots, attaining about three-fourths of an inch in length by autumn. They have six short legs, a pair to each of the first three rings behind the head. In October they descend into the earth beyond the reach of frost and hibernate till spring, when they gradually come toward the surface, and are in May transformed into pupæ, which in June become beetles, dig their way to the surface to feed upon the rose and other plants, and again go through the changes above described. It is during the insect state that they must be attacked for the purpose of reducing their numbers or exterminating them. They should be shaken from the plants and destroyed. Insectivorous birds (q.v.) destroy great quantities of them.

ROSECRANS, WILLIAM STARKE, b. Ohio, 1819; graduated at West Point, and became assistant engineer on the fortifications at Hampton Roads. He was professor of engineering and natural philosophy at West Point, 1844-47, and resigned from the army in 1854 to go into business. At the beginning of the war he volunteered as aid-de-camp to gen. McClellan, then in command of the department of the Ohio. He was soon made brig.gen., was prominent in the campaign in West Virginia, and took command of that department on the promotion of McClellan to the chief command. Made maj.gen. of volunteers early in 1862, and, commanding the army of the Mississippi, he won the battles of Iuka and Corinth in the fall of that year. Placed in command of the army of the Cumberland, he fought with Bragg at Stone river, Dec. 26, 1862, to Jan. 2, 1863. Having crossed the Tennessee river and the Cumberland mountains he was defeated by Bragg at the battle of Chickamauga, Sept. 19 and 20, and soon afterward was succeeded by gen. Thomas. In 1864 he took command of the department of the Missouri. He resigned from the U. S. army in 1867. He was for a short time minister to Mexico, 1865-69, and was elected to congress from California in 1880.

ROSE-ENGINE. See TURNING.

ROSELLINI, IPPOLITO, 1800-43; b. Pisa, Italy; educated at the universities of Pisa and Bologna, making a specialty of archaeological study and philology. In 1824 he was made professor of oriental languages at Pisa. He accompanied Champollion, the famous orientalist, in explorations in Italy, and, in 1828, through Egypt and Nubia. The results of their investigations were published in *I Monumenti dell' Egitto e della Nubia*, in 10 vols., 8 of which were published before Rosellini's death.

ROSEMARY, *Rosmarinus*, a genus of plants of the natural order *labiate*, and nearly allied to sage (*salvia*), from which it differs in its filaments having an awl-shaped tooth, directed downward a little above the base. Only one species is known, *R. officinalis*, an evergreen erect shrub of 4 to 8 ft. high, with linear leaves, and pale bluish flowers, growing in sunny places, on rocks, old walls, etc., in the countries around the Mediterranean sea, and generally cultivated, as an ornamental and aromatic shrub, throughout the rest of Europe. The leaves have a short whitish-gray down beneath, a penetrating champhor-like odor, and a pungent aromatic and bitter taste. They contain a large quantity of an essential oil, *oil of rosemary* ($C_{10}H_{16}O_2$), which is not unfrequently used as a stimulating liniment, to promote the growth of the hair, and as a perfume. *Spirit of rosemary*, made by distillation of sprigs of rosemary with rectified spirit, is used to give a pleasant odor to lotions and liniments. Rosemary has been advantageously administered internally in cases of chronic diarrhea, and of a relaxed state of the system.—Oil of rosemary

is a principal ingredient of the perfume called *Hungary water*, or *queen of Hungary's water*.—The name wild rosemary is given to *ledum palustre*, a shrub with narcotic acrid properties.

ROSEN, FRIEDR. AUG., b. in Hanover, Sept. 2, 1805, entered Leipsic university in 1822, where he devoted himself to the study of the biblico-oriental languages, and went to Berlin in 1824, where he studied Sanskrit under Bopp, and published his first work, *Rudices Sanscritæ* (Berl. 1827). Subsequently, he was called to London university as professor of oriental literature, where he edited the oldest of the still extant Arabic hand-books of algebra, by Mohammed ben Musa (Lond. 1831). In 1831 Rosen resigned his professorship. During the next few years he wrote a portion of the oriental articles for the *Penny Cyclopædia*, undertook the revision of the Sanskrit Bengali dictionary of Houghton (Lond. 1835), which may be considered entirely his own work, and compiled for the British museum the catalogue of Syrian manuscripts, which was only published after his death (Lond. 1839). As secretary of the Asiatic society, he conducted its entire foreign correspondence. Colebrooke intrusted to him the publication of his *Miscellaneous Essays* (2 vols., Lond. 1837). In 1836 he had begun the publication of the collection of hymns of the *Rigveda*, when he died Sept. 12, 1837. His unfinished work on the Vedas was published by the Asiatic society under the title *Rigvedu-Sukhita, Uer primus, Sanscritæ et Latine* (Lond. 1838).—His younger brother, GEORGE ROSEN, has also acquired a reputation as an oriental scholar.

ROSENAU, a t. of Hungary, beautifully situated on the Sajo, 165 m. n.e. of Pesth. It has colleges and a Franciscan convent. There is mining done in the neighborhood, and there are manufactures of woolen cloth and linen, of stone-ware, leather, and paper. Pop. '69, 4,355.

ROSENKRANZ, JOHANN KARL FRIEDRICH, b. Germany, 1805; educated at Halle, where he was professor, 1831-33. He studied the philosophies of Schlegelmacher and Hegel, and in 1833 became professor at Königsberg, where he remains, succeeding Herbart and Kant. He belongs to the so-called "center" group of Hegelians. Besides his works in general literature, he has done much in the way of a reclassification of Hegel's system. Among his works are *Psychology*, 1837; *Critical Explanations of Hegel's System*, 1840; *History of Kant's Philosophy*, 1840; *Life of Hegel*, 1844; *Science of the Logical Idea; Hegel as the National Philosopher of Germany*, 1870; and *New Studies*, 1875.

ROSENMÜLLER, JOHANN GEORG, a German divine and professor of theology was b. at Ummerstädt in Hildburghausen, Dec. 18, 1736. He was appointed professor of theology at Erlangen in 1773, primary professor of divinity at Giessen in 1783, and was called in 1785 to Leipsic, where he remained till his death in 1815. His chief writings are: *Morgen- und Abendgedanken* (7th ed. Leip. 1820); *Betrachtungen über die Vornehmsten Wahrheiten der Religion auf alle Tage des Jahres* (4 vols. Leip. 1801); *Auserlesenes Beicht- und Communionsbuch* (12th ed. Nürnberg, 1827); *Predigten über Auserlesene Stellen der Heiligen Schrift* (3 vols. Leip. 1811-13); *Beiträge zur Homiletik* (Leip. 1814); *Scholia in Novum Testamentum* (6 vols.; 6th edit. by his son, E. F. K. Rosenmüller, Leip. 1815-31); and his *Historia Interpretationis Librorum Sacrorum in Ecclesia Christiana* (5 vols. Leip. 1795-1814). After his death appeared *Handbuch eines Allgemeinen fasslichen Unterrichts in der Christlichen Glaubens- und Sittenlehre* (2 vols. Leip. 1818-19).—**ERNEST FRIEDRICH KARL ROSENMÜLLER**, eldest son of the foregoing, distinguished himself as a biblical critic and orientalist. He was born at Hlessberg in Hildburghausen, Dec. 10, 1768, studied at Leipsic, became extraordinary professor of oriental literature in 1795, ordinary professor in 1813, and died Sept. 17, 1835. He was a more accurate and solid scholar and a keener critic than his father. He shared the rationalism of his time, but never carried it to an extreme. His masterpiece, the *Scholia in Vetus Testamentum* (11 vols. Leip. 1788-1835), is a most comprehensive and learned production, well worthy of consultation on any important point of biblical criticism. Other works of Rosenmüller's are: *Handbuch für die Literatur der Biblischen Kritik und Exegese* (4 vols. Göt. 1797-1800); *Das Alte und Neue Morgenland oder Erläuterungen der Heiligen Schrift* (3 vols. Leip. 1818-20); *Handbuch der Biblischen Alterthumskunde* (4 vols. Leip. 1822-31); *Institutiones ad Fundamenta Lingue Arabicæ* (Leip. 1818); and *Analecra Arabica* (2 vols. Leip. 1825-26).—A younger brother, **JOHANN CHRISTIAN ROSENMÜLLER** (b. 1771, d. 1820), also acquired a reputation as a writer on anatomy, etc.

ROSE-NOBLE (commonly called also *penny of gold*), an English gold coin, first struck by king Edward III. in 1334, and current at the value of 6s. 8d. sterling; half-nobles, *oboli*, or gold half-pence, and quarter-nobles, otherwise called *gold farthings* and *quadrantes*, were also coined soon after. The term "rose-noble" was given to the coin because it was of the same value as the "noble," a money of account, and was stamped on one side with the figure of a rose. The rose-noble and its halves and quarters ceased to be coined after 9 Henry V.; but the "noble," the money of account, was used till a much more recent period.—The noble also existed in the Scotch coinage, and was equivalent to one-twelfth of the English coin.

ROSE OF JERICHO, *Anastatica hierochuntica*, a plant of the natural order *crucifereæ*, which grows in the sandy deserts of Arabia, and on rubbish, the roofs of houses, and other such situations, in Syria and other parts of the east. It is a small, bushy, herba-

ceous plant, seldom more than six inches high; with small white flowers; and after it has flowered, the leaves fall off, and the branches become incurved toward the center, so that the plant assumes an almost globular form, and in this state it is often blown about by the wind in the desert. When it happens to be blown into water, the branches expand again, and the pods open and let out the seeds. Numerous superstitions are connected with this plant, which is called *rosa Maria*, or *rose of the Virgin*. If taken up before it is quite withered, the plant retains its hygrometric property of contracting in drought and expanding in moisture, for years.

ROSEOLA is a common skin disease, included in the division *rashes*, and sometimes described under the term *scarlet rash*. In some cases it begins with slight febrile symptoms and gastric disturbance, which subside in two or three days, when the rash appears; in other cases, no preliminary fever occurs. The eruption first appears upon the face, neck, and chest, in specks or small patches, which have a tendency to coalesce; and in severe cases the whole surface of the body assumes a uniformly red tint. The eruption is usually accompanied by itching of the affected parts, and by redness and slight soreness of the throat, and seldom lasts more than two or three days, when it gradually fades away; and its disappearance is not followed by the desquamation of epidermis, which is one of the natural *sequelæ* of scarlatina and certain other skin diseases. The rash differs considerably in appearance in different cases. The disease is never contagious, and one attack affords no immunity from a second.

Among the causes of roseola may be mentioned the irritation excited by dentition, gastric and intestinal irritation, excessive acidity of the stomach, the sudden checking of profuse perspiration, the drinking of cold water when the body is over-heated, etc. It often precedes the distinctive eruptions of small-pox and varioloid; and is noticed to be of most frequent occurrence during the prevalence of measles and scarlatina. The diseases with which it may be confounded are erythema, measles, and scarlatina, and it is sometimes impossible to discriminate with certainty between roseola and mild cases of scarlatina, when the former is attended with sore throat. The treatment is very simple, as the disease would probably always terminate favorably if left entirely to itself. If there is a suspicion that the case should turn out to be one of scarlatina, an emetic of ipecacuanha should be given, and the bowels should be freely acted on. In ordinary cases, a few days' confinement to the house, a spare and non-stimulating diet, saline laxatives—such as seditiz powders—and an occasional warm bath, if there is much cutaneous irritation, or if the eruption has a tendency to recede too suddenly, constitute all the treatment that is expedient.

ROSE QUARTZ, a variety of quartz (q.v.), often crystallized in the form of rock-crystal (q.v.), but also found massive or imperfectly crystallized. It differs from common quartz and rock-crystal chiefly in its color, which is of a delicate pink or flesh-color, sometimes crimson or nearly so. The color is due to the presence of manganese. Rose quartz is valued as an ornamental stone, the larger masses being made into vases, etc., the smaller pieces into jewels, seals, etc. A bright red kind is known as *Bohemian ruby*, and is sometimes fraudulently sold as ruby.

ROSES. WAR OF THE, a disastrous civil contest which desolated England during the 30 years from 1455 to 1485, sacrificing 80 princes of the blood, and the larger proportion of the ancient nobility of the country. It was so called because the two factions into which the country was divided upheld the two several claims to the throne of the houses of York and Lancaster, whose badges were the white and the red rose respectively. After the house of Lancaster had possessed the throne for three generations (see **PLANTAGENET**), Richard, duke of York, whose title to the throne was superior to that of Henry VI., began to advance, at first somewhat covertly, his claim to the throne. In 1454 he was appointed protector of the realm during Henry's illness, and on the king's recovery he declined to give up his power, and levied an army to maintain it. For an account of the wars of the roses, see **EDWARD IV.**, **EDWARD V.**, **RICHARD III.**, and **HENRY VII.** The accession of Henry VII. may be said to have terminated the wars of the roses, although the reign of Henry was from time to time disturbed by the pretensions of Yorkist impostors.

ROSETTA, a city of Egypt, situated on the w. bank of the old Bolbitic branch of the Nile, about 4 m. above the mouth, in 31° 25' n. lat. and 30° 28' 20" e. long. The name is supposed to be an old Egyptian one, and to have been derived from *rusat*, or the mouth of the plains. Here was discovered the so-called Rosetta stone, or trilingual inscription in the hieroglyphic, demotic or enchorial, and Greek language, which was the key to the interpretation of the hieroglyphs. It is of black basalt, about 3 ft. 7 in. in length, and 2 ft. 6 in. in width, containing about one-third of the hieroglyphic, and nearly all the Greek and Roman portions, the upper part and portion of the side having been broken away. The contents of the inscription are a decree in honor of Ptolemy, Epiphanes by the priests of Egypt assembled in a synod at Memphis, on account of his remission of arrears of taxes and dues owed by the sacerdotal body. It was set up 195 B.C., and is the only one of the numerous examples ordered to be placed which has been brought to light. This monument was discovered in 1799 by M. Boussard, a French officer of engineers, during the French occupation of Egypt, in an excavation made at fort St. Julien, near Rosetta. More recent excavations have shown that it was

found on the site of a temple dedicated by the Necho II. of the 26th dynasty to the solar god Atum, or Tum. By the Arabs, Rosetta is called Rashid. It first rose into importance when the accumulation of mud had silted up the Damietta branch, and destroyed the importance of that city. It has been much praised for its verdure and charming gardens, which present an agreeable contrast to the barren wastes by which it is surrounded. It contains a mixed population, supposed to be about 16,000 in number. The streets are narrow, running n. and south. The river has a sandbar at the mouth, preventing the entrance of large ships of war. It was unsuccessfully attacked by the British in 1807.

ROSETTA WOOD is a furniture-wood of a lively orange-red color, with very dark veins. It is imported from the East Indies in logs about a foot in diameter; but it is not known what tree produces it. It is little used, because, although extremely beautiful when first cut, the colors become dark by exposure.

ROSE-WATER. See **PERFUMERY.**

ROSE-WINDOW, a circular window with tracery.

ROSEWOOD, a name given to the wood of a number of different trees, valued for beauty; and used for ornamental furniture.—The rosewood of commerce has been thought to be the produce of a species of *mimosa*, a native of Brazil. It is also said that rosewood is the timber of several species of *triptolomea* (natural order *leguminosae*, suborder *papilionaceae*); but the trees yielding rosewood are, in general, still doubtful to the botanist, although different kinds of rosewood, imported from South America, are much used for veneering, in making furniture, musical instruments, etc. Rosewood has for a long time been second only to mahogany as a furniture-wood in Europe. It has a dark blackish-brown color, beautifully marked with streaks of dark red, and when being sawn or cut, yields an agreeable smell of roses, from which it receives its name. We receive it chiefly from Para and Maranham, in logs usually about 10 ft. in length; each log is only half the trunk, which is split in two to be sure it is sound. Violet wood and king wood are from similar trees. The name rosewood has been also given to kinds of timber grown in Jamaica, in Africa, and in Burmah. One valuable kind of rosewood is yielded by an East Indian tree, *dalbergia latifolia*, also called *blackwood*. It is found chiefly in Malabar, and grows to a height of about 50 feet. It is of the natural order *leguminosae*, suborder *papilionaceae*. The timber is very valuable. It is much used in Bombay for ornamental furniture. Planks of 4 ft. in breadth are sometimes obtained, after the sapwood has been removed. The increasing value of the wood has led to the formation of new plantations, under the care of the government conservator of forests, in several parts of the Madras presidency.

ROSI-CRUCIANS, the name of a secret society of the 17th c., which is involved in much mystery, and the history of which has led to a great deal of discussion. The name is explained by Mosheim and others, as derived from *ros*, dew, and *crux*, the cross. *CRUX* is supposed mystically to represent *LUX* or light, because the figure \dagger exhibits the three letters LVX; and light, in the opinion of the Rosicrucians, is that which produces gold. Now dew (*ros*) is the greatest solvent of gold in the ancient science of alchemy. But without insisting on this very mysterious explanation of the name Rosicrucians, we must be content with an account of the association itself. The beginning of the 17th c. was a period which manifested an extraordinary tendency to mysticism in science as well as in religion; alchemy, astrology, and divination divided the public interest with Pictism in the Protestant world, and the Convulsionist mania in the Catholic community. A remarkable impulse was given to this tendency by the simultaneous appearance of two anonymous books, printed at Cassel in 1614, in German, entitled *Universal and General Reformation of the whole wide World*; together with the *Fama Fratemitatis, or Brotherhood of the Illustrious Order of the R. C. (Rosy Cross); to the Rulers, States, and Learned of Europe; printed at Cassel, by William Wessel*. The first of these books is a kind of mystic allegory. In the reign of Justinian, Apollo, finding the world full of every kind of corruption, resolves on effecting a reformation; and with this view, calls up the seven wise men of Greece, and three Roman philosophers, of whom Cato and Seneca are the chief advisers. Their deliberation forms the subject of the book, which is a satire at once on the philosophy and the political systems and governments of the age. The *Fama Fratemitatis* is the story of a certain holy and reverend brother Christian Rosenkreuz (i. e., Rosy Cross), who is represented as living in the 14th century. This father, a German of noble birth, having been educated in a monastery, conceives a design for the reformation of the world; and after learning at Jerusalem and Damascus all the science of the Arabians, spends three years at Fez, in Morocco, in the study of the magical science of the Moors, and returns to Germany, where he establishes, in a house under the title Sancti Spiritus, with the aid of seven monks from the convent where he had been educated, a fraternity, which is the original brotherhood of the Rosy Cross. These adepts having framed a system with secret symbols, and committed it to paper, sent forth father Rosenkreuz to propagate the brotherhood, which was to be kept secret for 100 years, the members, however, meeting once each year in the mother-house of Sancti Spiritus. Rosenkreuz died at the age of 106, and the place of his burial was held secret by the adepts; but he ordered that an inscription should be

placed on one of the doors of Sancti Spiritus: "Post cxx. annos patebo." In the following year, 1615, a third tract appeared, also in German, entitled *Confessio, or Confession of the Society and Brotherhood R. C.*, which purports to be a defense of the brotherhood from the false rumors in circulation regarding it. The mixture of absurdity with seeming fanaticism displayed in these books has long proved a literary puzzle, of which not the least plausible solution is that which regards them as simply a serio-comic satire on the philosophical follies of the time, written by Johann Valentine Andrea, of Herrenberg, as a mere exercise of humor, and without the intention or the expectation of their serious acceptance. Certain it is, that whatever was the secret of the Rosicrucians, if there really was any, it has been well kept. They are not heard of for the rest of the 17th c., and their supposed connection with the Illuminati of Weishaupt, at the close of the 18th c., is more than doubtful. Equally doubtful is the theory of their connection with the Templars. From a book entitled *Curious Things of the Outside World: Last Fire* (Lond. 1861), it would appear that the brethren of the Rosy Cross are not yet extinct. See Buhle, *Über Ursprung und Schicksale des Ordens der Rosenkreuzer* (Gött. 1803); Jennings's *Rosicrucians* (1870).

ROSEIN, CHEMISTRY OF. See RESINS. When common turpentine (q.v.), obtained from several species of pine (q.v.) and fir (q.v.), is distilled with water, it yields nearly one-fourth of its weight of essential oil, while the residue in the retort consists of *common rosin*, or colophony. There are two principal varieties of rosin, one of which is of a brown, and the other of a white color. The brown variety is furnished by the Norway spruce fir, and is an amber-colored brittle solid, consisting of two isomeric acids, the *sylicic* and *pinic*, having the common formula, $C_{10}H_{15}O_2$. Pinic acid, which is the more abundant of the two, is soluble in cold alcohol, from which it is obtained on evaporation as an amorphous mass. When heated to partial decomposition, it yields another isomeric acid, the *colophonic*. The white variety of rosin, known commercially as *galipot*, is obtained from the turpentine yielded by *pinus maritima* (see PINE), and consists almost entirely of an acid, isomeric with the preceding, and termed the *pinari*. On evaporating its alcoholic solution, the acid is obtained in a semi-crystalline form; and on melting the mass thus obtained, and allowing it to cool, the resulting product is a colorless glass as clear as crystal.

Common rosin dissolves freely in alkaline solutions, and enters largely into the formation of yellow soap. The alkaline resinsates are, in point of fact, true soaps, but are inferior in their cleansing properties to the stearates, oleates, and margarates. All the above described acids of rosin are monobasic, soluble in ether and hot alcohol, and insoluble in water.

ROS'KILDE, a t. in s.e. Denmark, called also Roar's Springs, in the island of Seeland, on an eminence overlooking a branch of the Ise-fjord river; pop. 5,221. Previous to 1443 it was the capital of the kingdom and the residence of the royal family, but its decline was consequent on the rapid growth of Copenhagen, and fire and the ravages of the plague destroyed its prospects. It contains a magnificent cathedral erected 1047-84, having many interesting monuments, and the tombs of Danish kings. In 1658 a treaty of peace was concluded here between Charles X. (Gustavus), of Sweden, and Frederick III. of Denmark. It is 19 m. s.w. of Copenhagen, with which it is connected by a railroad.

ROSMINI SERBATI, ANTONIO, 1797-1855, b. Italy; entered the priesthood in 1824. He founded a religious order, called "the brethren of charity," in 1828, and in 1833 became abbot of San Michele della Chiusa. There he founded the order called "sisters of providence." Pius IX. nominated him cardinal in 1848; but the nomination failed on account of Rosmini's work on church reform, called *The Five Wounds of the Church*, which, with his tract, *The Constitution According to Social Justice*, was put upon the *Index Expurgatorius*. His works are published in 35 volumes.

ROSNY, LEON DE, b. France, 1837; educated at Paris. He attained a deep knowledge of philology, oriental languages, and kindred subjects, and in 1863 was interpreter to the Japanese embassy. In 1868 he became instructor in Japanese at the Paris school of oriental languages. M. Rosny is also the founder of the society of American and oriental ethnography. He has published many pamphlets and text books on subjects connected with his speciality.

ROSOLIC ACID, or **AURIN**, also called *corallin*, a red coloring matter used in dyeing, made by heating phenol (carbolic acid, q.v.) with oxalic and sulphuric acids. In this reaction the oxalic acid is resolved into carbonic acid (CO_2), carbonic oxide (CO), and water (H_2O). The carbonic oxide then reacts on the phenol as follows:

To obtain a pure product, the mixture of sulphuric acid and phenol must be heated on a water bath, and the oxalic acid added gradually, not using enough to attack all the phenol. A commercial dye-stuff, known as aurin, corallin, or pæonin, which gives a fine yellow-red color to woollens and silks, is prepared in a similar manner. It is a mixture of several substances, but may be purified by treatment with aqua-ammonia, which

dissolves the extraneous matters, leaving a residue of nearly pure aurin. The same compound is obtained by the action of nitrous acid on rosaniline; and it is reconverted into that base by heating with ammonia in an aqueous or alcoholic solution. Rosolic acid crystallizes from its alcoholic solution in red prisms with a green metallic luster. It is insoluble in water, soluble in alcohol, strong hydrochloric acid, and glacial acetic acid. It unites with sulphurous anhydride, forming garnet-colored crystals having the composition $4C_{20}H_{14}O_8, 2SO_2 + 11H_2O$. By reduction with zinc dust in alcoholic solution, rosolic acid is converted into *leucaurin*, $C_{20}H_{16}O_8$, which crystallizes from alcohol in colorless prisms, and is reconverted into rosolic acid by oxidation.

ROSS, a Celtic word, meaning a headland, occurring as the name or part of the name of many places in the British Islands, and in other parts of Europe, as Roslin, Culross, Rosberg, Ross (in England), Montrose, Roxburgh, Ardrossan. There is another Welsh root, *rhos*, signifying a moor, which is found in Welsh and Cornish names, as Rossall, Rusholme. In Rosecess, in Orkney, the equivalent Teutonic term *ness* has been superadded after the meaning of the Celtic *ross* had been lost.

ROSS, a co. in S. Ohio, watered by the Scioto river and Paint creek; on the Ohio and Erie canal, and the Marietta and Cincinnati railroad; 650 sq. m.; pop. '80, 40,307—37,745 of American birth. The surface is diversified. The soil is fertile. The principal productions are corn, wheat, oats tobacco, hay, and wool. There are carriage manufactories, flour mills, woolen mills, leather manufactories. Co. seat, Chillicothe.

ROSS, a thriving market t. in Herefordshire, is finely situated on the left bank of the Wye, 14 m. s. s. e. of Hereford. In the parish church (date 1216) is buried John Kyrle, celebrated by Pope as the "Man of Ross" (q. v.). The town is well furnished with schools, carries on a trade in cider, malt, and wool; is much visited by tourists, and contained (1871) 3,586 inhabitants.

ROSS, ALEXANDER, 1699-1784; b. Scotland; educated at Marischal college; acted as tutor and school teacher in several places, and in 1733 settled as school-master at Lochlee, in Angus, where he remained until his death. He was all his life a writer of verses, but it was not until 1763 that he published his first book, *The Fortunate Shepherdess, a Pastoral Tale in the Scottish Dialect*, which has a humorous preface by Dr. James Beattie, and contains some songs still popular in Scotland.

ROSS, ALEXANDER, 1742-1827; b. London; entered active service in the army as ensign in 1760; served in Germany with the allied army, attained the rank of capt. in the 45th, 1775; subsequently col. of the 59th and governor of Fort George. He served through the American war as capt. of grenadiers and aid-de-camp to lord Cornwallis; brevetted maj. 1781. He was one of the commission appointed by Cornwallis to arrange his surrender at Yorktown; and was adjutant in Scotland and in the East Indies, with the same commander-in-chief, and fought in every battle; promoted to gen. 1812. His son Charles edited and published the Cornwallis correspondence.

ROSS, ALEXANDER MILTON, b. Canada, 1832; studied medicine. He traveled over Canada, and made a complete collection of the birds of the Dominion, numbering 323 species. His entomological collection contains 10,000 specimens. He has published *Birds of Canada*, 1871; and *Butterflies and Moths of Canada*, 1872. He has made a large botanical collection.

ROSS, CHARLEY, b. Germantown, Penn., 1870; his full name was Charles Brewster Ross, son of Christian K. Ross. On June 27, 29, 30, and July 1, 1874, the child was accosted, while playing in the streets of Germantown with his brother, by two men in a buggy, who on each occasion gave the two boys candy, and on the last took them for a drive. The elder boy was sent to buy fire-crackers on reaching Kingston, Philadelphia, and on returning to where he had left the buggy, he found it had disappeared, with his brother. He was picked up by a gentleman and returned to his home. From that time until the present writing (April, 1881) the boy Charley Ross has not been seen by his relatives, although the police and press of the country, and the entire American public, have been interested in the search for him. Anonymous letters to Mr. Ross indicated that the abduction was for the purpose of obtaining money; but though a reward of \$20,000 was offered by the mayor of Philadelphia, and this amount was demanded by the abductors of the child, the latter was not given up. A long series of communications, by letter and through the personal columns of various newspapers, effected nothing—mainly because Mr. Ross was in the hands of advisers who induced him to persist in efforts to capture the abductors. These efforts were discerned by the latter, and rendered futile whenever made. On numerous occasions the boy was reported found, and the unhappy father traveled over many parts of the country, and inspected many homeless and friendless boys who bore some resemblance to his lost son, but always without success.

ROSS, GEORGE, 1730-79; b. Delaware; began the practice of law at Lancaster, Penn., in 1751. He was a member of the colonial assembly of Pennsylvania 1768-76, of the legislature which succeeded that body, and of the continental congress, 1774-77. He was appointed a judge of the court of admiralty in 1779.

ROSS, Sir JAMES CLARK, Arctic explorer (nephew of sir John), third son of George Ross, esq., of Balsarroch, Wigtonshire, was b. in London April 15, 1800. He entered

the navy in his 12th year, and served under his uncle in the Baltic, the White sea, the coast of Scotland, and in all the naval expeditions for the discovery of the north-west passage (q.v.) from 1818 to 1833. It was while accompanying his uncle in his second Arctic voyage that he discovered, 1831, the n. magnetic pole, and on his return he was rewarded with a post-captaincy. Afterward employed by the admiralty in a magnetic survey of Great Britain and Ireland, he, in 1836, crossed the Atlantic to relieve the frozen whalers in Baffin's bay; and in 1839 he was placed in command of an expedition to the Antarctic seas (see POLAR EXPEDITIONS), and approached within 160 m. of the s. magnetic pole. On his return, in 1843, he received the honor of knighthood; and in 1847 he published his *Voyage of Discovery in Southern Seas, 1839-43*. In Jan., 1848, he made a voyage in the *Enterprise* to Baffin's bay, in search of sir John Franklin, but without success. He received the "Founder's gold medal" from the geographical society of London in 1841, the gold medal of the Paris society, and D.C.L. from Oxford in 1844. He died in 1862.

ROSS, Sir JOHN, C.B., Arctic voyager, b. June 24, 1777, at Balsarroch, Wigtonshire, was a son of the rev. Andrew Ross of Inch. He entered the navy at the early age of 10, was 15 years a midshipman, 7 years a lieut., 7 years a commander, and became a post-capt. in 1818. When lieut. of the *Syrincom* he was wounded in cutting out a Spanish vessel from under the batteries of Bilbao, in 1806. During the war he was in three different actions. His more important services were rendered in the Arctic regions, whither, in 1818, he proceeded with sir W. E. Parry. See NORTH-WEST PASSAGE. He published the results of his investigations in 1819. In May, 1829, he was employed on a fresh expedition to the Arctic regions (fitted out at his own expense by sir Felix Booth), and discovered the peninsula of "Boothia Felix." Ross received, on his return, the honor of knighthood, and was made C.B. He received the freedom of London and other cities, gold medals from the geographical societies of London and Paris, was made a knight of various foreign orders, and received other acknowledgments of his services. In 1838 he was appointed British consul at Stockholm, where he remained some years. He was author of *Letters to Young Sea-officers; Residence in Arctic Regions, etc.* (1829-34), 4to; appendix to same, 4to; *Memoirs and Correspondence of Admiral Lord de Saumarez*, 2 vols. 8vo; *Treatise on Navigation by Steam*, 4to. He became a rear-admiral in 1851, and died Aug. 30, 1856, at his house in Gillingham street, Pimlico.

ROSS, JOHN, or KOOWESKOOWE. 1790-1866; b. Ga.; a half-breed, who received an English education, and was made chief of the Cherokees in 1828. In 1835, with more than 15,000 Cherokees, he protested to the president against the treaty between the United States and a part of the Cherokees, ceding their lands and agreeing to remove to the west. The treaty was, however, enforced by the government. Ross made a treaty with the confederate states in 1861.

ROSS, ROBERT, about 1770-1814; b. Ross Trevor, Devonshire, England; graduate of Trinity college, Dublin; served in the army with distinction in Holland and Egypt; was at Maida and at Corunna, under sir John Moore; brigade commander at Vittoria and the Pyrenees, under Wellington; wounded at Orthey. He came to this country, and in the war of 1812 defeated Washington's troops at Bladensburg, burned and pillaged the city of Washington in 1814, and was killed at North Point, Md., while marching on Baltimore.

ROSS, Sir WILLIAM CHARLES. 1794-1860; b. London; son of an artist. He became a student of the Royal academy, and when but 13 years old gained a prize from the society of arts, a success which he repeated for four years. In 1817 he became an assistant of Robertson, the noted miniature painter, and soon gained celebrity in that branch of the art. In 1837 he was appointed miniature painter to the queen, and in 1842 was knighted. He executed a few historical and fanciful pictures.

ROSS AND CROMARTY, treated of in the "Census of Scotland—1871," as one Scottish co. is, as such, bounded on the n. by Sutherlandshire, e. by the German ocean, s. by Inverness-shire, and w. by the Atlantic. Ross comprises the districts of Easter and Wester Ross, Ardmeanach, or the Black isle, and the island of Lewis (q.v.). Ross and Cromarty in many parts present a wild and mountainous aspect, intersected by beautiful glens, valleys, lakes, and rivers. Many of the mountains are of considerable altitude, the highest ranging from 3,000 to 4,000 ft., the most remarkable of which is Ben Wyvis. The high grounds afford excellent pasture for sheep and cattle, and the glens and low grounds, in the more favored portions, are generally of a superior soil, which, with the fine climate, especially in Easter Ross, produce grain of a superior quality. There are numerous fresh-water lakes and rivers. The principal loch is Marce (q.v.). There are several other lakes of considerable size, which, altogether, occupy an area of 90 sq. miles. There are numerous water-courses, the chief of which are the rivers Oikel and Conou, and several high waterfalls, the principal being Glomach, one of the finest in the kingdom. Limestone and ironstone are to be met with in abundance, as also granite and mica slate; and there are various mineral springs of note, the most famous of which is that of Strathpeffer. About the beginning of last century the country in many places was nearly devoid of trees, but soon after numerous plantations were formed, and many parts are now occupied by extensive forests. The lakes, rivers,

and coast abound with fish, and the bays and sea-lochs being numerous, the fisheries are carried on extensively, occupying upward of 22,000 persons.

According to the census of 1871 the area of the two counties is 3,151 sq. m., or 2,016,375 statute acres. The valued rental in 1674 was £7,000; the valuation of 1875-76 (exclusive of railways) was £260,164. The total acreage under all kinds of crops, bare fallow, and grass, in 1876 was 124,826; under corn crops, 47,413, under green crops, 27,259; clover, sanfoin, and grasses under rotation, 29,987; the permanent pasture, exclusive of heath and mountain-land, was 19,395. The number of horses used for agricultural purposes was, in the same year, 7,099; the cattle counted 41,609; the sheep, 362,980; and the pigs, 6,407.

The population of the united shires in 1871 was 80,955. The parliamentary constituency, which returns one member to parliament, is 1580 in number. The chief towns are Dingwall (q.v.), Fortrose (q.v.), and Tain (q.v.).

ROSSANENSIS CODEX, a manuscript recently discovered at Rossano in southern Italy, containing all of Matthew and nearly all of Mark, written on purple parchment in double columns, in silver and gold uncial letters with no breathings, accents, or separation of words, and very little punctuation. The sections of Ammonius are marked in it. It is adorned with painted miniatures of scenes in the life of Christ, and heads of Old Testament prophets. Various criteria indicate that it was written not later than the beginning of the 6th century. The text resembles that of the only other purple manuscript, has some unique readings, and rather favors later codices where they differ from the Sinaitic and Vatican.

ROSSA NO, a city of southern Italy, in the province of Cosenza, is situated at the foot of the Apennines, 2 m. from the gulf of Taranto, on a high, rocky hill, surrounded by steep precipices. It is walled and well built, is defended by a castle, and contains a beautiful cathedral, inlaid with carved marbles. Its fields are very fertile, producing grapes and lemons. Rossano was laid waste by Totila, king of the Goths. Pop. '72, 14,818.

ROSSBACH, a village in Prussian Saxony, in the government of Merseburg, and 8 m. s.w. of the city of that name, is celebrated in history for the victory here gained by the Prussians under Frederick the great over the combined French and imperialist armies on Nov. 5, 1757. A short time previously Frederick had been compelled to leave the bulk of his army in Silesia under the duke of Brunswick-Bevern to check the Austrians on this side, and hastened with 22,000 men to oppose the invasion from the west. The prince of Soubise (one of the "amateur" French generals of the period), who was at the head of the confederate army of 60,000 men, thinking from Frederick's cautious maneuvers that he was terrified and desirous of retreating, at once charged forward with his cavalry, and left his columns at the mercy of gen. Seidlitz, who attacked them in front and flank with the whole of the Prussian cavalry and artillery. The confederates were speedily thrown into utter disorder, and, being charged in front by the Prussian infantry under prince Henry, their rout was complete. The "rout of Rossbach" was so utterly disgraceful that it remained for a long time proverbial in the French army. The Prussians lost (according to a French account) only 300 men, while the loss of the allies was more than 1200 slain, 6,000 prisoners, among whom were 11 gens. and 300 officers, and 72 cannon, with many other trophies.

ROSSE, WILLIAM PARSONS, third Earl of, a well-known practical astronomer, was born in York in 1800, and educated first at Trinity college, Dublin, and afterward at Magdalen college, Oxford, where he graduated first-class in mathematics in 1822. During the life of his father he sat in the house of commons as lord Oxmantown, representing King's county from 1821 to 1831; he succeeded to the peerage in 1841, and was elected a representative peer for Ireland in 1845. At an early age Rosse had devoted much attention to the study of practical science, and especially to the improvement of the telescope, and had commenced as far back as 1826 to make experiments in the construction of fluid lenses (see *Philosophical Transactions* for 1840), but he subsequently relinquished those investigations, to engage himself with the problem of the best mode of constructing the speculum of the reflecting telescope. The two great defects which had hitherto baffled opticians were "spherical aberration" and absorption of light by specula; and in the casting of these of large size, there was the apparent impossibility of preventing cracking and warping of the surface on cooling. However, by a long series of carefully conducted experiments, he succeeded in discovering a mode of operation by which the last defect was wholly obviated, and the two others greatly diminished in amount. The metal for the speculum of his great telescope (see TELESCOPE), three tons' weight, was poured into the iron mold April, 1842, the crucibles being lifted and emptied by means of cranes; and the mold was kept in an annealing oven for 16 weeks, so that the metal should cool equably. It was then polished and mounted in his park at Parsonstown, at a cost of £30,000, the adjustments consisting of a system of chains, pulleys, and counterpoising weights, so complete in all its parts, that the ponderous instrument of 12 tons' weight can be moved so as to point in any direction, and with almost as much precision as the ordinary equatorial of the observatory. The first addition to the body of astronomical knowledge made by this telescope was the resolution of certain nebulae, which had defied Herschel's instrument, into groups of stars; next came

the discovery of numerous binary and trinary stars, and a description of the moon's surface. This telescope, constructed under Rosse's personal directions, is described in the *Philosophical Transactions*. He died in 1867, and a statue to his memory was erected in Parsonstown in 1876.

ROSSETTI, DANTE GABRIELE, son of Gabrielle, distinguished as a thoughtful and powerful painter, a graceful poet, and an elegant translator of early Italian poetry, was born in London in 1828, and educated at King's college, London. As a painter, he is more talked of than known, probably because his works are transferred into private collections as soon as they leave his studio, and without undergoing the publicity of exhibition. Although he has never exhibited at the "Royal academy," his pictures are occasionally sent by their proprietors to various public picture-galleries. Of these, his "Fair Rosamond," a picture pervaded by earnest thought, and treated in a powerful, though strikingly unconventional manner, was exhibited in the galleries of the Royal Scottish academy in 1860-61, and may be taken as a good example of the artist's manner. Of his other pictures, the chief are "Ecce Ancilla Domini," and "Beatrice Dead." He contributed some fine drawings to an illustrated edition of Tennyson, which, although inadequately engraved, rank among the first of modern wood-cuts. These, like everything this artist has produced, are strongly imbued with the spirit of the romantic period. Rossetti's name was first brought prominently forward by his association with Millais and Holman Hunt in the "preraphaelite brotherhood." In 1850 he was editor of *The Germ*, a magazine of poetry and art devoted to the furtherance of the views of the "brethren," and to the inculcation of their fundamental principle, which was direct study from nature herself, unfettered by the conventionalities of the "antique" and "academics." While time and experience have modified the practice of some of the original preraphaelites, Rossetti's pictures still display the peculiarities of earlier days. As an author, Rossetti is well known by his *Early Italian Poets from Ciullo d'Alcamo to Dante Alighieri* (1100-1200-1300) (Lond. Smith, Elder & Co., 1861). In this work the translator achieves the rare success of not only catching the spirit of Dante, but of rendering the great poet in his own meters, and with a marvelous fidelity of thought and phrase. In conjunction with his brother WILLIAM, he edited Gilchrist's *Life of William Blake, Pictor Ignobis* (Lond. 1853), left incomplete at the death of the compiler. *Poems* (1870) added to Rossetti's reputation.

Rossetti is not only a painter and author, but a man of thorough acquaintance with and high accomplishment in applied and decorative art. He has borne a distinguished part in the resuscitation of Gothic art in England, both ecclesiastical and domestic.—CHRISTINA ROSSETTI, sister of the above, and born 1830, has earned considerable literary reputation from her *Goblin Market and other Poems* (1852), *The Prince's Progress* (1856); *Speaking Likenesses* (1874), etc.—WILLIAM ROSSETTI has earned a name as an accomplished critical writer from his *Criticism on the Poems and Ballads of Swinburne* (1863), e.c.—Another sister, MARIA (born 1827, died 1876), was known as the author of an able study of Dante.

ROSSETTI, GABRIELE, a celebrated Italian author, was b. at Vasto in 1783, and came to England as a political refugee in 1824. Two years afterward he published the *Comento Anulitico on the Divina Commedia* of Dante, in which he aimed to show that in the middle ages all the poets used a jargon under which they veiled their hatred of the papacy, and concealed the true religion under the form of a woman beloved by them. In conducting this argument he displayed amazing erudition. His opinions naturally excited a great deal of hostile criticism. Rossetti replied to his opponents with the work, *Sullo Spirito Antipapale che Produsse la Riforma, e sulla Influenza che Esercità nella Letteratura di tutta l'Europa e Principalmente d'Italia* (1830). But this book did not convince them either, and then Rossetti sought to reduce to method his system, and published *Il Mistero dell'Amor Platonico sveluto* (1840), and *La Beatrice di Dante*. Whatever may be thought of Rossetti, he has at least founded a new school of interpretation of Dante, and his partisans are numerous in Italy. His name is well known in the peninsula for his national poems, which have gained for him the title of the Italian Tyrtæus. These are contained in the *Dio e l'Uomo* (1840); *Il Veggente in Solitudine* (1846); *L'Arpa Evangelica* (1852); *Poesie di Gabriele Rossetti* (1847). He was professor of Italian literature in King's college, London, and was honored and esteemed by many of the most eminent public men in England. He died in London in 1854.

ROSSI, GIOVANNI BATTISTA DE, b. Italy, 1822; studied archæology and early Christian inscriptions under father Marchi. He has given an account of his discoveries in his *Inscriptiones Christianæ Urbis Romæ septimo Seculo Antiquiores*, of which the first volume appeared in 1861, and which is a collection of the Christian inscriptions to the number of over 11,000. His researches in the catacombs are also the basis of his *Roma sotterranea Cristiana*. He has edited the *Bolletino di Archeologia*, and is a member of the Berlin academy of inscriptions.

ROSSI, PELLEGRINO, was b. of a noble family at Carrara in 1787. He carried on his studies at the university of Bologna. In 1812, being 25 years of age, he was appointed professor of law in that university. In 1815, king Murat having proclaimed Italian independence, Rossi sided with him. On the fall of Murat, Rossi was exiled. He took refuge at Geneva, where he was appointed professor of the science of law. There he

published *Le Droit Pénal*, a very learned work, which made him famous in France. In 1833 Louis-Philippe called him to Paris, and appointed him professor of political economy. Then Rossi commenced the course *Du Droit Constitutionnel*, and the government, in order to reward the great publicist, naturalized him, and made him a member of the chamber of peers. Protected by Guizot, the prime-minister, Rossi was sent to Rome as ambassador in 1845. There he witnessed all the events of 1848 and took part in them, having again become an Italian subject after the fall of Louis-Philippe. When called to the ministry by Pius IX., Rossi wished to oppose the party favorable to the house of Savoy, and devised an alliance with the king of Naples, which had for its object a confederation of Italian princes with the pope as their president. This roused the hatred of the Romans, and Rossi was stabbed by an unknown hand on Nov. 15, 1848. In 1860 Luigi Carlo Farini decreed the publication of all the writings of Rossi, and that a bust of him should be given to the university of Bologna, where it was inaugurated with great solemnity on April 27, 1862. Besides the *Droit Pénal*, Rossi published the *Cours d'Economie Politique* (1840); the *Lettere d'un Dilettante Politico sull'Allemagna, sulla Francia, e sull'Italia* (Florence, 1848); and left many inedited writings, which, after his death, were published in Paris at the expense of the Italian government.

ROSSIE NY, a t. of European Russia, in the government of Kovno, 66 m. n.w. from Kovno, on the Dubitzka, a branch of the Niemen. Under the Polish government it was the capital of Samogitia. Pop. '67, 10,732.

ROSSINI, GIOACCHINO, the greatest composer of the present century for the Italian lyrical stage. He was born at Pesaro in 1792, the son of a horn-player in an orchestra of strolling players. At the age of fifteen the countess Perticari, discovering his talent, sent him to study at the lyceum of Bologna, where he received instructions in counterpoint from padre Mattei. He was, however, principally self-taught, giving days and nights to the study of the great Italian and German masters. Passing over a few juvenile efforts, his first important opera was *Tancredi*, which was performed in Venice in 1813, and excited an extraordinary sensation throughout the musical world, raising its composer at once to the summit of fame. It was followed in succession by *L'Italiano in Algeri* (1813), *Il Turco in Italia* (1814); and *Aureliano in Palmira* (1814); all inferior to *Tancredi*. In 1815 Rossini was appointed musical-director of the theater of San Carlo at Naples; and while holding that position he continued to produce operas both at Naples and elsewhere. *Il Barbiere di Siviglia*, the most popular of all his works, was produced at Rome in 1816, and said to have been composed in twenty days; it was followed by *Otello* in the same year; and in 1817 appeared *La Cenerentola* at Rome, and *La Gazza ladra* at Naples. From this time to the close of Rossini's engagement at Naples in 1823, he wrote the operas of *Mosè in Egitto*, *La Donna del Lago*, *Maometto Secondo* (otherwise known as *L'Assedio di Corinto*), and *Zelmira*. In 1823 he produced *Semiramide*, the most gorgeous of his operas, at Venice, and soon afterward left Italy. He first visited Paris, and then London, where he was received with great enthusiasm. Returning to Paris, he received from Charles X. the appointment of director of the Italian opera in Paris, and while there composed his *Guillaume Tell* (1826), which, though ill-constructed as a drama, ranks musically as high as any of his works. When the revolution of 1830 broke out, Rossini lost the management of the Italian opera, but continued to live for some time in Paris; in 1836 he returned to Italy, where, with the exception of a visit to Paris, he principally resided till 1855. With *Guillaume Tell* he may almost be said to have closed his career, having after it composed nothing of importance except his well-known *Stabat Mater*, a pretty and popular work more secular than sacred in its style of music. Large offers from the managers of opera houses did not succeed in tempting him from his retirement. His statue was inaugurated at Pesaro in 1864, amid a large concourse of Italian statesmen and men of letters. In Rossini's early works he developed with great felicity the type established by his Italian predecessors. These compositions are characterized by stirring melody, brilliant instrumentation, and a highly enjoyable vivacity. *Guillaume Tell*, though equally original, approaches far more nearly to the character of the German school. Much as Rossini's music continues to be prized, only four of his forty operas composed from 1810 to 1829 have kept the stage. *Il Barbiere*, *Otello*, *La Gazza ladra*, and *Semiramide*. He died Nov., 1868.

ROSSITER, THOMAS P., 1818-71; b. New Haven, Conn.; at an early age showed a taste for art. He studied with Jocelyn, a portrait painter of some note, and in 1838 began the painting of portraits as a profession. In 1840 he went to Rome and spent six years in study there and at other art centers of Europe. From 1853 to 1856 he was in Paris; and at the exposition of 1855 was awarded a gold medal. The latter part of his life was spent in Cold Spring on the Hudson. Besides many portraits he painted several historical and scriptural pictures. Among the best are "The Jews in Captivity;" "Miriam;" "Joan of Arc in Prison;" and "House of Washington."

ROSS, THE MAN OF, a name given by Pope to John Kyrle, an English gentleman of great benevolence, who was born at Whitehouse, Gloucestershire, in the first half of the 17th century. Kyrle received his appellation from having resided during the greater part of his life in the small town of Ross, Herefordshire. He there spent his time and fortune in building churches and hospitals, which procured for him the love and veneration of his contemporaries. Kyrle may be considered the Howard of his age; and War

ton, in his *Essay on the Writings and Genius of Pope*, has stated that he deserved to be celebrated beyond any of the heroes of Pindar.

Pope, during his visits at the old mansion of Holm Lacy, the seat of viscount Scudamore, near Ross, heard so much of Kyrle's beneficence, that in his *Moral Essays* he celebrates his praises under the name of the Man of Ross:

Behold the market-place with poor o'erspread!
The Man of Ross divides the weekly bread:
He feeds yon almshouse, neat, but void of state,
Where age and want sit smiling at the gate:
Him portioned mads, apprenticed orphans blessed,
The young who labor, and the old who rest.

We learn further, from the same poem, that the fortune of Kyrle was no more than £500 a year. Kyrle died in 1724, and was buried in the church of Ross.

ROSSO ANTICO, the technical name for the red porphyry of Egypt. It consists of a red feldspathic base, in which are disseminated rose-colored crystals of oligoclase with some plates of hornblende, and grains of oxidized iron ore.

ROSTER (corrupted from register) is a fixed order preserved in military departments as the rotation in which individuals, companies, or larger bodies are called on to serve. Regiments proceed on foreign service according to the roster.

ROSTOCK, the most important t. and seaport of the grand duchy of Mecklenburg-Schwerin, stands in a flat fruitful district on the Warnow, 9 m. from the mouth of that river in the Baltic, and 55 m. n.e. of Schwerin by railway. It is surrounded by ramparts and walls pierced by 12 gates, and has still a mediæval aspect. The university, founded in 1419, maintains 39 professors and lecturers, and has a library of 120,000 volumes. The handsome new university building is a renaissance structure in brick. In St. Mary's church, a large building dating from the 13th c., and possessing one of the finest organs in Germany, is the tomb of Grotius. St. Peter's, dating from the 12th c., has a tower 420 ft. high. There are several squares, of which Blücher's square contains a colossal monument of the gen. of that name. Manufactures of linen and tobacco, and tanning, brewing, and distilling are carried on. In the year 1866 the town of Rostock owned 377 vessels. The exports are chiefly wheat, barley, oil-cakes, and cattle-bones to Great Britain. The imports are coals, salt, iron, limestone, herrings and other provisions, timber, etc. At the mouth of the Warnow is Warnemünde, the port of Rostock, at which all vessels drawing more than 10 ft. load and unload. Pop. of Rostock '75, 34,172.—Rostock is of Slavic origin, and a shadowy glimpse of it is got in the 11th or 12th c., but the progress of commerce and other causes, chiefly political, rapidly Germanized it, and in 1218 it figures as wholly German. It was a member for centuries of the old Hanseatic league, long ranked in importance with Lübeck, and still enjoys to a wonderful extent its ancient privileges—the municipal constitution of the town being even yet almost wholly republican.

ROSTOF, a t. of European Russia, and one of the most ancient in the empire, in the government of Jaroslav, stands on the banks of lake Nero or Rostofsky. An important fair is held here, and a flourishing commerce, which the railway from Jaroslav to Moscow promises to increase, is carried on. Rostof contains numerous factories, the chief manufacture being that of linen. Pop. '67, 11,805.

ROSTOF-ON-THE-DON, a district t. and ferry of s. Russia, in the government of Ekaterinoslav, stands high on the right bank, and at the head of the delta of the Don. It owes its origin to the foundation of the fortress of St. Dmitri here in 1749, since which time the progress of the town, owing to its advantageous situation, has been so great that it is now the center of trade in s. Russia. Its custom-house was erected in 1835, and in that year the customs' dues amounted to £150,000. The annual exports have amounted to £1,198,526, the principal articles being wheat, iron, tallow, and linseed. Manufactures are carried on with activity in 22 factories, the principal articles produced being cast-iron, bricks, ropes, tobacco, macaroni, soap, and leather. Railway communication with Vladikaukas in Caucasia was opened in 1875. Pop. '67, 39,129.

ROSTOPCHINE, FEODOR VASSILEVITCH, Count, a Russian gen., directly descended from Genghis Khan, was b. in the province of Orel, Mar. 23, 1765; and, after having filled for some time the office of page to Catharine II., entered the Russian military service as a lieut. in the imperial guard. In 1784 he set out on a course of foreign travel, returning to St. Petersburg in 1792, and obtaining, through the powerful influence of some friends, the post of gentleman-of-the-chamber. Having the good fortune to be the first messenger to Paul of his accession to the throne, he was immediately (1796) created gen., a rise in rank speedily followed by the successive appointments of grand-marshal of the court, minister of foreign affairs, count (1799), and chevalier of all the Russian orders. Rostopchine possessed extraordinary influence over the mind of the half-witted monarch, and succeeded in preventing his vagaries from seriously affecting the government or religion of the empire; but he was repeatedly banished from court and almost immediately recalled, and it was during the last of these banishments (to Moscow) that the czar was murdered. The emperor Alexander seems to have disliked him, for Rostopchine remained in a state of banishment till May, 1812, when, having need of the services of all his subjects, and knowing Rostopchine's distinguished patriot-

ism, Alexander appointed him governor of Moscow. On the approach of the French Rostopchine, by extraordinary exertions, raised an army of 122,000 men fully equipped, but to his great chagrin was ordered to evacuate Moscow. Rostopchine has been unanimously branded by the French writers as the burner of Moscow, and for a long time this was generally credited in the west, till, in 1823, he published in his own defense, *La Vérité sur l'Incendie de Moscou* (Paris, 1823), in which he rebuts the charge, affirming that this barbarous action was due in part to the fervid patriotism of a few of the inhabitants, and in part to the violence and negligence of the French. At the same time he showed that the damage done to Moscow was much less than the estimate given by French and English writers, and that the Kremlin, which the French had attempted to blow up, had been in reality little injured. Rostopchine certainly set fire to his own mansion-house in the neighborhood, but no other act of incendiarism has been proved against him, the accusations published in the *British Monitor* (1822) having been triumphantly rebutted. He had succeeded in repairing much of the damage done to the city, and in re-collecting many of its former inhabitants, when, through a court intrigue, his dismissal from office was effected (August 30, 1814). Rostopchine accompanied the emperor Alexander to the congress of Vienna, and subsequently (1817) retired to Paris, where he occupied himself in literary pursuits, and in forming a fine collection of pictures and books. In 1825 he returned to Russia, and died Jan. 30, 1826, at Moscow. His wife and one of his sons have made for themselves names in literature, and his daughter-in-law, the countess EUDOXIA ROSTOPCHINE, is considered as one of the first poets of Russia. Rostopchine's works, which include a number of historical memoirs, comedies, etc., in Russian and French, were collected and published at St. Petersburg in 1853.

ROT is known in the south-western counties of England under the provincial names of bane, coa, or coathe. It consists in the maturation within the liver and biliary ducts of an entozoon, the *distomum hepaticum*, or fluke (q.v.). Although most frequent among sheep, it also occasionally attacks rabbits, hares, deer, and cattle. Until of late years, the annual losses amongst the flocks of Great Britain were estimated at a million; but in 1809, 1824, 1830, and 1833 this large mortality is believed to have been doubled. During the wet winter of 1852-53, and again in the autumn of 1860, and early months of 1861, rot was extensively prevalent. Autumn and early winter are the periods of its most frequent occurrence. Close damp weather, inducing a rapid growth of soft, luxuriant herbage, favors its development. The rising of the Nile is said to rot annually 16,000 sheep. Low, damp, marshy situations, water-meadows, undrained lands, especially when of a clayey, retentive consistence, furnish a large proportion of cases. The hay from such localities induces rot almost as readily as the fresh grass. Sheep grazed even for a few hours upon land subject to rot, or taking a single draught from an infected stagnant pool, may contract the disorder, most probably by swallowing the young flukes. From 15 to 40 days usually elapse before any serious consequences follow from the presence of the parasite. At first, indeed, digestion appears to be stimulated, and the sheep thrive rather better than before; but by and by they rapidly waste, their wool becomes dry, and easily detached, their bowels irregular, their skin and mucous membranes yellow, as is usually conveniently observed by examining the eye and its pearly caruncle, which in rot loses the brilliancy of health, and exhibits a dingy yellow hue. The body, after death, is soft, flaccid, and indifferently nourished; watery effusions are discovered underneath the jaws and in other dependent parts; the small quantities of unabsorbed fat have a dirty yellow color; the liver is soft and enlarged, and usually mottled with patches of congestion. In the thick and muddy bile, the flukes, with their myriads of spawn, float in variable numbers.

The treatment of rot is seldom very satisfactory; and if the animals, when first affected, are in tolerable condition, no time should be lost in having them slaughtered. If remedial measures are attempted, the sheep should be removed to a dry and sound situation, and liberally supplied with dry nutritive food. During the summer allow corn or cake with the grass; during the winter, when cases are most frequent, supply clover-hay, peas, or split beans, a little bruised linseed cake, and a few roots: pieces of rock-salt should also be laid about the ground for the patients to lick at. Medicines are seldom of much avail. Those most to be relied on are turpentine and powdered gentian in two-dram doses, given daily, beat up with an egg and a little milk, or with some linseed gruel. The turpentine, besides acting beneficially as a stimulant, doubtless also exercises a poisonous action on the flukes, whilst the gentian imparts tone to the irritable and relaxed bowels. The prevention of rot is usually effected by removing from the land all superfluous moisture by deep and thorough drainage. The improvement of unsound herbage may subsequently be expedited by dressings of lime, salt, soil, or composts of farm-yard manure and earth. On all suspicious grazings, beans and oats should for a time be given in moderate quantity, and access allowed to rock-salt. The Arab and Bédouin shepherds have for centuries recognized the importance of such measures, for, when their flocks became rotten from depasturing on the rank herbage that shoots up after the rising of the Nile, they often prevent serious loss by promptly transferring them to the desert, where the dry forage-plants are very rich in saline matters. The Australian flock-master likewise checks the complaint by promptly removing his sheep

which have become tainted from the deep alluvial soils to the poorer upland "salt-brash" countries. In like manner, the salt marshes of Cheshire, and the saltings left along our coasts by the tides, have long enjoyed a well-deserved celebrity in the prevention, and even in early cases in the cure, of sheep-rot.

ROTA, a t. of Spain, in the province of Cadiz, and 6 m. n.n.w. from Cadiz, on the opposite side of the entrance of Cadiz bay. Rota wine has acquired some celebrity, and is brought to the British market. Pop. 8,000.

ROTANG. See RATTAN.

ROTATION (Lat. *rotā*). There is, perhaps, no elementary idea which has been the subject of so much popular misconception as that of rotation. This is probably due to the vagueness of the definitions commonly given.

All motion that we can observe is *relative*; for instance, any fixed object on the earth's surface has a certain motion *relative* to the earth's axis, in consequence of the diurnal rotation; the earth itself has a certain motion *relative* to the sun, in consequence of its annual revolution; the sun has a certain motion *relative* to the so-called fixed stars; and it is possible that the whole stellar system may have a motion *relative* to something in space beyond its boundaries. Now, the motion of an object on the earth's surface differs according to the way it is measured: a passenger sitting in a railway carriage is *at rest* if his motion *relative* to the carriage be considered; he has the same motion as the carriage if it be measured *relative* to the rails; and if the carriage were running from e. to w. along a parallel of latitude, so as to complete the circuit in 24 hours, he would be at rest *relative* to the earth's axis. If, therefore, we wish to talk of *absolute* motion, it must be measured *relative* to *FIXED* points or directions; and in the violation of this obvious condition lies the error most commonly met with. Thus, to show that the earth rotates about its axis, we may observe its motion *relative* to the line joining it with the moon; and we observe that the moon comes to the meridian at intervals of (roughly) 25 hours. Does the earth rotate in 25 hours? We know that it does not, and the error consists in treating as an *absolute* rotation, a rotation measured *relative* to a line—that joining the earth and moon—which is itself turning. If we take the intervals of the sun's crossing the meridian, we find 24 hours—a much closer approximation; but still not exact, because our line of reference—that joining the earth and sun—is slowly turning. Would we have an absolute measure, we must choose a *fixed* line, or one so nearly fixed that its motion is absolutely insensible. Such is the line joining any fixed star with the earth, and the time of the earth's *absolute* rotation about its axis is $23^{\text{h}} 56^{\text{m}} 4.09^{\text{s}}$ —the interval between culminations of the same fixed star. The difference between absolute and relative rotation in any planet gives rise to the difference between the *sidereal* and the *solar* day; and the planet's year contains just *one* more of the former than of the latter.

Now, suppose for a moment that the earth were to revolve only $\frac{1}{365.25}$ part as fast as it now does, there would be *one sidereal* day in the year, and there would be *no* solar day at all—in other words, there would be *no* rotation of the earth with reference to the line joining it with the sun; that is, the earth would turn always the same side to the sun; yet it would be *absolutely* rotating about its axis once in a year. This is the case which we observe in the moon's motion *relative* to the earth, and we see at once that the moon must rotate *absolutely*—that is, with reference to fixed directions in space—in the exact time in which she completes one revolution about the earth. Those who say the moon does not rotate on her axis make precisely the same mistake as those who fancied that the earth is immovable, and that moon, sun, and stars revolve about it every day. There is a physical cause for this peculiarity in the moon's motion, which leads to very important consequences with reference to the future of the solar system. See TIDES.

Several elementary theorems regarding rotation may now be enunciated; but the proofs, though very simple, will be given merely in outline. Any displacement *what-*

ever given to a plane figure in its own plane—as to a sheet of paper lying on a table—is equivalent to a single rotation about a definite axis. Let A, B be any two points of the figure, and let them be displaced to A', B' respectively. Join AA', BB', and bisect them in a and b by perpendiculars meeting in O. Then, it is easy to show that (1.) OA' = OA, OB' = OB, and therefore O is the *same* point of the plane figure in its first and second positions. (2.) $\angle AOA' = \angle BOB'$, and is therefore the angle through which the whole has been turned about the point O. If AA' and BB' are parallel, this construction fails; but in this case, if AB and A'B' do *not* intersect, the motion is simply one of translation: if they

do intersect, the point of intersection is the axis. Any number of successive rotations about different points constitute, of course, a displacement, and are therefore reducible to one rotation.

Two equal and opposite rotations about different points give rise to a mere translation. The first two of these propositions are true of figures on a sphere as well as on a

plane surface; for the figure above has only to be drawn with great circles instead of straight lines, and the proof applies letter for letter. Only, here, the first case of exception cannot occur, because two great circles *must* intersect. Hence it follows that if the center of a sphere be fixed, any displacement whatever is equivalent to a rotation about some axis; that is, after any motion whatever of a rigid body, one point of which is fixed, there is always *one* line of particles which remains undisturbed. [This simple proposition has been found very hard to believe, even by men of considerable intelligence.] Hence rotations about any number of axes passing through the same fixed point may be compounded into one; and, generally, any motion whatever of a rigid body may be decomposed into two, one of which is a motion of translation of some chosen point, and the other rotation about some axis through that point. Thus, in the case of the moon, we have a motion of translation of its center in its orbit, and one of rotation about its axis; or we may combine them into a single rotation in the period of a lunar month about a fixed axis passing through the earth's center.

Again, any displacement of a plane figure in its plane, or of a spherical figure on a sphere, may be produced by the rolling of a curve fixed in the figure upon another fixed on the plane or sphere. Hence, the most general motion of a body with reference to one point, consists in the rolling of a cone fixed in the body upon another fixed in space, their vertices being at the chosen point. To this, when the cones in question are right circular cones, belong the *precession* (q. v.) and *nutation* (q. v.) of the earth and of a top, the evolutions of an ill-thrown quoit, etc.

ROTA'TION OF CROPS. The plants, like the animals of the farm, differ much in their habits, and in the different sorts of food on which they subsist. The broad-leaved clovers, turnips, and mangold abstract from the air a large proportion of the materials of their growth; whilst the narrower-leaved grains and grasses, especially if their seeds are ripened, partake more largely of mineral food withdrawn from the soil. The cereals require for their healthy nutrition large supplies of phosphoric acid and silica; leguminous plants devour a large share of lime; turnips, carrots, and clover take up a great amount of potash. Corn-crops, occupying the ground during the greater part of the year, favor the growth of weeds; well-tended root-crops, on the other hand, afford better opportunity for deep culture, for the extirpation of weeds, for the convenient application of manures; whilst, being in great part consumed on the land, they raise its fertility. Mainly from such considerations, the farmer of arable land is led to grow a succession of dissimilar plants, or, in other words, to adopt a rotation of crops. The cereals exhausting the farm, on account of their ripened seeds being sold off, are generally alternated with fallow, root, or cleansing crops, or with beans and peas, which occupy a kind of intermediate position between the cereals and the roots; while clovers or grasses are taken at intervals of six or eight years. The rotation most suitable for a particular farm is, however, greatly modified by various circumstances, and especially by the nature of the soil, climate, markets, available supplies of extra manures, amount of live stock kept, etc. That course of cropping is evidently the most desirable which will economically secure, with thorough cleanness of the soil, a high and increasing state of fertility.

Many rotations are based upon the Norfolk or four-course system, which consists of (1) Clover or mixed grass seeds; (2) Wheat, or in many parts of Scotland, oats; (3) Turnips, Swedes, mangold, potatoes, or bare fallow; (4) Barley. The details of this system are generally as follows: The clovers or grasses are mown or grazed; when cut, they are either used green or are dried for hay; the second crop is carted home for the cattle or horses; near towns, it is sold off; or it is consumed on the ground in racks by sheep, which on most highly cultivated farms receive besides a daily allowance of cake or corn. In districts where town-manure can be obtained, a top dressing is applied as soon as the first crop of grass is cut. On the poor and worse cultivated soils, the grass-crop occasionally remains down for two, or even three years, thus extending a four into a five or six years' rotation. The clovers or mixed seeds are plowed up in autumn, and followed generally in England by wheat, and in Scotland by oats. These crops are now usually drilled, to admit of horse and hand hoeing. After harvest, the stubble is, if possible, cleaned by the scarifier, grubber, or plow and harrows; or, where the management for several years has been good, any patches of couch-grass or other weeds are best forked out by hand. The land, especially if heavy, or intended for mangold drilled on the flat, as practiced in the drier parts of England, may then be manured and deeply plowed the grubber and harrows, in April or May, suffice to prepare for the drilling of mangold or Swedes. Heavy land, intended either for roots or barley, should in spring be plowed or disturbed as little as possible. In Scotland, and the cooler moist climates of the north and west of England, turnips and potatoes are grown on raised drills or balks, in which the manure lies immediately underneath the plant. Frequent horse and hand hoeings should insure the thorough cleaning of the crop. Unless in the neighborhood of towns, where it is greatly more profitable to sell off the whole of the root-crop, part of the Swedes or mangold is taken home for the cattle, but the largest portion is consumed by sheep in the field. After the fallow or cleaning crop, another cereal crop is grown: under the Norfolk system, this is generally barley, with which the clovers or seeds are sown out. Where sewage or tank water is available, Italian rye-grass is often used, and on land in high condition, early large and repeated cuttings are

obtained; but rye-grass has the disadvantage of being a worse preparation than clover for the wheat-crop which usually follows. The chief failing of the four-course system consists in the frequent recurrence of clover, which cannot be successfully grown oftener than once in six or eight years. To obviate this difficulty, one-half of the clover quarter is now often put under beans, peas, or vetches, thus keeping the grass or clover seeds eight years apart.

The Norfolk four-course system is unsuitable for heavy land, where a large breadth of roots cannot be profitably grown, and where their place, as a cleaning crop, is taken by bare fallow, vetches, or pulse. Bare fallows are, however, less frequent than formerly, being now confined to the most refractory of clays, or to subjects that are so hopelessly fully of weeds as to require for their extirpation several weeks of summer weather, and the repeated use of the steam or horse plows, the scarifier, grubber, and harrows. In such circumstances, winter vetches are often put in during September or October, are eaten off by sheep and horses in June or July, and the land afterward cleaned: this practice is extensively pursued on the heavier lands in the midland and southern counties of England. In such localities the following system is approved of: (1) The clover leas are seeded with (2) wheat; then come (3) beans, pulse, or vetches, manured, horse, or hand hoed; (4) On good land, wheat succeeds; (5) Oats or barley often follow, but to prevent undue exhaustion of plant-food, this system requires considerable outlay in artificial manures, cake, and corn; (6) A fallow, or fallow crop, deeply and thoroughly cultivated, and well manured, comes to restore cleanness and fertility; (7) Barley or wheat is drilled, and amongst this, the clover-seeds are sown. On the heavier carse-lands in Scotland the following plan of cropping is generally practiced: (1) Clover; (2) Oats; (3) Beans; (4) Wheat; (5) Bare fallow or fallow crop, usually including a considerable breadth of potatoes; (6) Wheat; (7) Barley, with which the clovers or mixed grasses are sown. Under this system it is difficult, with so few cleaning crops, to keep the land clean; roots, besides, are not produced in quantities sufficient properly to supply either cattle or sheep during the winter. To remedy these defects, roots may be introduced after the oats, and would be followed either by wheat or barley. This extends the rotation from seven to nine years.

In all well-cultivated districts, whether of heavy or light land, stock-farming is extending, and a more vigorous effort is being made to raise the fertility of the land. Root-crops are accordingly more largely grown; indeed, it is sometimes found profitable to grow two root-crops consecutively; thus, after turnips, Swedes, cabbage, or man-gold, well manured from the town or farmyard, and eaten off by sheep, potatoes of superior quality are produced with one plowing, and a dose of portable manure. Specialties of in management occur in almost every locality. In Essex, winter-beans follow wheat, are got off in August, and are succeeded by common turnips. Near London, and in other southern districts, early potatoes or peas are grown for market, and are immediately followed by turnips. In many parts of England, where the soil and climate are good, rye or vetches sown in autumn are consumed in early summer, and a root-crop then put in.

Good rotations do not necessarily insure good farming; they are merely means to an end. By carefully removing weeds, by deeply stirring the soil, and by applying appropriate manures, wheat may be grown on the same soil for an indefinite number of years. At Lois-Weedon, in Northamptonshire, the rev. S. Smith has for 20 years cultivated alternate three-foot strips of wheat and well-forked bare fallow; the land that is wheat this year being fallowed next. Although no manure whatever is applied, and only one-half of the experimental plot is each year under crop, the yield continues to stand at four quarters per acre, which is about four bushels per acre in excess of the average acreable produce of Great Britain. The Lois-Weedon system, owing to the outlay which it entails for manual labor, probably could not be carried out with profit on a large scale. It demonstrates, however, the inherent resources lying dormant, especially in clay soils, and indicates how they may be rendered available by thorough cultivation. It is mainly by such cultivation that steam-power proves so serviceable in our fields. The soil is turned up deeply to the disintegrating solvent influences of wind and weather; the necessary operations are rapidly overtaken in good season; much work is accomplished in autumn; treading and poaching of the surface is avoided; while a larger breadth of roots is attainable for the healthy and economical support of the sheep and cattle stock, which not only directly enhance the returns of the farm, but also raise rapidly its manurial condition.

As agricultural education and enterprise extend, fixed rotations will be less regarded. The market gardener, who extracts a great deal more from his land than the farmer has hitherto been able to do, does not adhere to any definite system of cropping. If the farm is kept clean and in improving condition, there can be no harm in growing whatever crops it is adapted to produce. Cropping clauses are only requisite during the three or four last years of a tenancy. The restrictions found in some agreements preventing the growth of clover for seed, flax, and even potatoes, are inadmissible. Equally objectionable are clauses against the sale of particular sorts of produce, such as hay or roots. The farmer, if he is fit to be intrusted with the use of the land, ought to be permitted to grow or sell off any crop he pleases, provided an equivalent in manure be brought back. On well-cultivated land, in good condition, it is now the practice of the

best farmers to take oats or barley after wheat; indeed, some of the best malting barley in Essex, on the Scottish-carse lands, and elsewhere, is now grown after wheat. The frequent growth of cereals, and the heaviest of hay and root crops, even when removed from the farm, may be fairly compensated for by large doses of town-dung or of sewage. The plant-food disposed of in the more ordinary sales of the farm is economically restored by the use of bones or superphosphate, guano, or nitrate of soda, or by keeping plenty of sheep, penning them over the land, and supplying them liberally with cake and corn.

ROTATION, MAGNETISM OF. This was discovered by Arago in the years 1824-25. He observed that when a magnetic needle was made to oscillate immediately above a copper plate, it came sooner to rest than it did otherwise. The oscillations were made in the same time as when away from the plate, but they were less in extent; the plate seemed thus to act as a damper to the motions of the needle. This being the action of the plate at rest on the needle in motion, Arago reasoned that the needle at rest would be influenced by the plate in motion. Experiment confirmed his opinion. He made a copper disk revolve with great rapidity under a needle, resting on a bladder placed immediately above it, and quite unconnected with it, the middle of the needle being placed above the center of the disk. As expected, the needle deflected in the direction of the motion of the disk. The deflection of the needle increased with the rapidity of the motion, and when it reached a sufficient amount, the needle no longer remained in a fixed position, but turned round after the disk. This action of the revolving disk was attributed to what was then called the "magnetism of rotation," and the name has since been retained.

The explanation of this phenomenon was first made by Faraday (1832). He found it to arise from the reaction of currents, induced in the plate in motion by the magnet. The accompanying figure illustrates the electrical condition of the plate. PP is the plate, rotating in the direction indicated by the arrow; NS is the needle; and the lines with the arrow-heads indicate the general direction of the currents induced by rotation under the magnet in the plate. There are two complete circuits on each side of the disk, coinciding in the middle, and taking the direction CC. It is the conjoined current which affects the needle; it runs in a direction a little in advance of the needle, as the inductive power of the magnet takes some time to act. As the induced current lies below the needle, the deflection (according to Ampere's rule, see GALVANISM) takes place in the direction of the motion of the disk. When cuts are made in the disk in the line of the radii, it loses almost entirely its disturbing power; the currents formed in the whole disk can no longer take place, and those formed in the various sectors are weak in comparison; by filling up the vacant spaces with solder, the power is nearly restored to it. As is to be expected, the effect of the revolving plate depends on the conducting power of the material of which it is made. It is owing to its high conducting power that copper is so much used in these experiments; hence, also, it is that copper should be so much used in the construction of magnetic apparatus. A copper compass-box, for instance, is not only desirable, from its being free from iron, but it acts as a damper to bring the needle quickly to rest when disturbed.

FIG. 1.

The magnetism of rotation is only one of a large class of phenomena in which the motion, either of a magnet or of a conductor near it, induces an electric current in the conductor. We may here quote two experiments which may be looked upon as the converse of the magnetism of rotation. In the first experiment, a small cube of copper is hung by a thread to a frame, and placed between the poles of a powerful electro-magnet; the cube is sent into rapid rotation by the twist on the thread, previously given it; it is instantly brought to a halt, when the current is allowed to circulate in the coils of the magnet, and it begins its motion again when the current is turned off. In the second experiment, a disk of copper is made to rotate rapidly between the poles of an electro-magnet, by means of a handle and intervening wheel-works turned by the experimenter. When the current invests the soft iron poles with magnetism, the disk, moving freely before, appears suddenly to meet with an unseen resistance, and the rotation continues slowly or not at all. If persisted in, the rotation causes the disk to rise in temperature, the rise being proportionate, according to Foucault, to the square of the velocity of rotation. These and all similar phenomena illustrate a law that holds universally in magnetic induction, and was first enunciated by Lenz: *When a current is induced by the motion of a magnet or conductor, the inductive action tends to develop in the conductor a current in such a direction that its action will be to oppose the motion producing it.* Thus, in the last experiment, the part of the disk approaching the poles has a current developed in it which repels them, and the part leaving the poles, has a current induced in it which attracts them. The approach of the one part and the departure of the other are equally opposed by the currents induced in them. The same mode of explanation applies to the other experiments referred to.

ROTATORIA, or **ROTIFERA**, popularly known as **WHEEL-ANIMALCULES**, derive their name from the Latin word *rotu*, a wheel. They have received these names on account of the apparent rotation of certain disk-like ciliated organs which surround the mouth. Although some of the larger forms may be detected with the naked eye, they are as a class microscopic. They are widely diffused over the surface of the earth, inhabiting both salt and fresh water, and occurring in all climates. There has been much discussion as to their true place in nature. Ehrenberg regarded them as infusoria, and Dujardin adopted a similar view. There is, however, no doubt that their organization is far more complex than that of the infusoria, and the main question of dispute at the present day is whether they are most closely allied to the worms or to the crustaceans. Huxley maintains that they form a link connecting the echinoderms with the nematoid (or thread) worms, and that they constitute the lowest step of the echinoderm division of the annelida; while Leydig endeavors to show that on various anatomical, physiological, and embryological grounds they more nearly resemble crustaceans than worms, and proposes to call them *ciliated crustaceans*. Science is indebted to Leenwenhoek for the discovery of this remarkable class of animals. In the *Philosophical Transactions* for 1702 he described one of the commonest of these animals, now known as *rotifer vulgaris*, his attention having been especially directed toward its power of retaining its vitality after more or less complete desiccation—a fact which has been since confirmed by many other observers, and which is noticed in the article on **DORMANT VITALITY**. The rotatoria have usually an elongated form, and are in most cases covered with a smooth hard skin, which is thrown into folds by the contractions of the subcutaneous tissue. The animal consists of a head and body. The body usually terminates in a prolongation which, till recently, was termed the tail, but which is now known as the foot, and into which the intestines are never prolonged. The foot is composed of muscular and glandular structures, and often terminates in a pair of forceps, by which the animal can attach itself to leaves, etc. The body generally presents six segments, which are more or less distinctly marked in different genera. The head presents the characteristic rotatory organs and the mouth, which always lies in the midst of them, so as to receive particles drawn in by their whirlpool action. It is by means of these organs that they swim freely about, revolving on their axis, or when at rest producing vortex-like disturbances of the water. The form, number, and arrangement of these organs varies extremely in different genera, and has been made a basis of classification by Ehrenberg and others. The rotatory organ may be single, double, or multiple. It often consists of a disk supported by a pedicel, on whose borders are successive rows of regularly arranged cilia, the motion of which gives the appearance of rotation to the disk itself. In the genera *floscularia* and *stephanoceeros* these organs undergo peculiar modifications. In the former there are five or six button-like processes about the mouth, covered with very long bristles, which move feebly and scarcely give rise to vortices; while in the latter the rotatory apparatus consists of five tentacle-like ciliated processes, and the animal thus closely resembles the polyzoa (q.v.). The ciliated rotatory organs, unlike ordinary volatile cilia, are entirely under the animal's control. The digestive apparatus differs extremely in the two sexes, which are always distinct in these animals. In the female the digestive apparatus is well developed, consisting of a mouth opening into a muscular pharynx, which has two horny masticating organs which move laterally upon each other. The pharyngeal masticating apparatus is of a roundish form, and is composed of two jaws having one or several teeth, which are brought together laterally by the action of special muscles. For further information on the subject the reader is referred to a very exhaustive memoir by Mr. Gosse, "On the Structure, Functions, and Homologies of the Manducatory Organs of the Class Rotifera," in the *Philosophical Transactions* for 1856. Succeeding the pharynx is a narrow esophagus, which leads into a dilated stomach, from which proceeds an intestine, which opens externally by an anus. In all the males that have been hitherto discovered there is an entire absence of digestive organs, a rudimentary pharynx being the most that is ever observed. The nervous system in the rotatoria consists of a cerebral ganglion, with filaments radiating from it. No heart or vessels have been discovered but the respiratory organs are well developed. The sexual organs of the female are better known than those of the male. The ovary is round or oval, usually lies by the side of the stomach, and the oviduct proceeding from it usually opens into the cloaca. The ovaries only develop a few eggs at a time, and the nearly mature eggs may be readily observed in the body of the animal when examined under the microscope. These animals produce two distinct kinds of eggs, which are similar in their primary formation, but which differ in their ultimate destiny—namely, thin-shelled summer eggs and thick-shelled winter eggs. The young are liberated from the former immediately after their discharge, while they remain unhatched in the latter during the winter weather. As far as has hitherto been observed, the males, which are much fewer in number than the females, are developed only from summer eggs. Except in regard to their being totally devoid of a stomach or intestine, and in relation to the sexual organs (which in the male have been carefully examined by Mr. Gosse in his memoir "On the Diccious Character of the Rotifera," in the *Philosophical Transactions* for 1857), the organization of the males is similar to that of the females. The sexes are, however, so unlike that they would be taken for widely remote genera if their actual hatching had not been observed; the males and the eggs from which they

spring being much smaller than the females and the eggs from which they are produced. (In *brachionus amphicerus*, the female eggs were $\frac{1}{170}$ in. in length, while the male eggs were only $\frac{1}{367}$). The length of a female *brachionus doercai* an hour after birth was $\frac{1}{5}$ in., while the diameters of the empty shell were only $\frac{1}{175} \times \frac{1}{220}$ in.—a marvelous increase in so short a period. "Whether," says Mr. Gosse, "certain individuals produce only male and others only female young, or whether separate impregnations are required for the production of the separate sexes, I do not know; but from all my observations I gather that the development of the one sex never takes place coetaneously with that of the other; for male and female eggs are never seen attached to the same parent, and the immature eggs in the ovary invariably develop themselves into the same sex as those which are already extruded. The duration of life in the male is always very brief; I have never been able to preserve one alive for twenty-four hours. Their one business is to impregnate the females, and for this momentary occupation no supply of loss by assimilation of food is wanted, and hence we can understand the lack of the nutritive organism."

ROTCHÉ *Mergulus* or *Cephus*, a genus of the auk family (*alcedæ*), separated from the true auks, on account of the thick, short, and indistinctly grooved bill. The COMMON ROTCHÉ (*M.* or *C. melanoleucus*, or *M. alie*, formerly *alca alie*), known also as the LITTLE AUK, SEA DOVE, DOVEKIE, and GREENLAND DOVE, is about the size of a large pigeon; its general color is black, but the belly is white, and there is a white mark upon each wing. It is very abundant in the arctic seas, and immense flocks are seen on the coasts of Greenland, Spitzbergen, Melville island, etc. It is, however, truly oceanic in its habits, and scarcely visits the land except during the breeding season. Though comparatively rare on the British coast, it is pretty frequently seen in the Orkneys.

ROTHE, RICHARD, one of the first speculative divines of Germany, was b. at Posen in 1799, and became successively member, professor, director, and ephorus of the theological seminary of Wittenberg. In 1837 he was nominated professor of theology at the university of Heidelberg, which in 1849 he exchanged for Posen. In 1854, however, he removed again to Heidelberg. Vigorous grasp and independence of thought were his chief characteristics, but he never formed a school, in the strict sense of the term. One of his well-known works is the *System of Theological Ethics, or Moral Theology*—a complete system of speculative theology or theosophy. This work is to show that religious truth is not a series of disputable propositions, but a divine morality; in a word, to translate the scholastic dialect of the creeds back into the living language of the Sermon on the Mount. Another remarkable book of his is the *Beginnings of the Christian Church*, which, by the peculiarity of "stand-point" assumed by the author regarding church and state, evoked many fierce counter treatises, like Baur's *On the Origin of Episcopacy*. Rothe died at Heidelberg in 1867. His lectures on *Dogmatik* were published in 1870; *Sermons*, in 1872; and *Quiet Hours (Stille Stunden)*, the same year.

RO'THENBURG AN DER TAUBER, a small ancient t. of Bavaria, on the Tauber, 31 m. s.s.e. of Würzburg. Pop. '75, 5,772, who manufacture woolen cloth, paper, and gunpowder, and trade in corn and cattle.

ROTHERHAM, a market-town in the West Riding of Yorkshire, 6 m. e.n.e. of Sheffield, is situated on the slope of a hill on the right bank of the Don, immediately below the junction of that river with the Rother. On the middle of the ancient stone bridge that crosses the Don is a Gothic chapel formerly used as a prison. The Free Grammar-school, founded in 1584 and restored in 1858, and the court-house are handsome buildings. In the neighborhood are numerous coal and iron mines, which furnish materials for the manufactures, the chief of which are stoves, grates, nails, and engines. Pop. '72, 25,892. The union poorhouse, completed in 1839, is a spacious structure, capable of holding 314 inmates. The union comprises 27 townships or parishes.

In the vicinity of Rotherham are Roche abbey, erected in 1147, the masonry of which is still in a perfect state, and Conisborough castle, a massive ancient stronghold, which is still in a good state of preservation, but which will survive its natural decay in Scott's *Icanhoe*.

ROTHERMEL, PETER F., b. Penn. 1817; studied land-surveying, afterward painting. He began to paint portraits about 1840. He made a continental tour 1856-57. During this time he painted his "St. Agnes," now at St. Petersburg. His best-known works are "Patrick Henry before the House of Burgesses;" "De Soto discovering the Mississippi;" "Christian Martyrs in the Colosseum;" "Columbus before Isabella the Catholic;" and "The Battle of Gettysburg."

ROTHERSAY, a royal burgh, seaport, and favorite watering-place of Scotland, capital of the county of Bute, is beautifully situated on the n.e. shore of the island of that name, at the head of a deep bay, 40 m. w. of Glasgow by the river Clyde. The bay offers safe anchorage in any wind, and is spacious enough to contain the largest fleet. Owing to its numerous excellent schools and seminaries, hotels, shops, and warehouses, Rothesay presents all the advantages of a town, while the beautiful bay and the charming scenery of the island render it a favorite resort for sea-bathing and summer residence. The sheltered position and the extreme mildness of the climate have made it the resort of

large numbers of invalids, especially such as are affected with pulmonary disease. Fishing is the employment of a number of the inhabitants, and ship-building is carried on to a small extent, and at the pier nearly all the Clyde steamers to and from the West Highlands regularly touch. The harbor is commodious and solidly built. Pop. '71, 7,800, which increases indefinitely during the bathing season. Within recent years, a very handsome promenade has been constructed. There is an excellent hydropathic establishment, and also an aquarium. In the middle of the town are the ruins of Rothesay castle, which first receives historical mention in 1263. It has remained in ruins since 1685. The marquis of Bute has done a great deal to render this ruin a picturesque object to visit, and has cleared away some of the old houses which were too near it.

ROTHSCHILD, MEYER ANSELM, baron of the Austrian empire, was b. in the Jews' Alley, Frankfurt-on-the-Main, in 1743, and d. in 1812. He was brought up to be a priest of the Hebrew faith. Being a man of good character, he was employed by the senate to raise a loan in order to save Frankfurt from pillage by the French republican army. He obtained a loan from the landgrave (afterward elector) of Hesse-Cassel. The landgrave acquired immense sums by selling his subjects to fight for England and France. Napoleon, after the battle of Jena, pronounced the forfeiture of his estates, and a French army was on the march to his capital. He had accumulated in his palace vaults about a million sterling in silver, and sending for Rothschild to Cassel, he offered him the free use of the treasure, without interest, if he would convey it to a place of safety. With the aid of his Jewish friends, Rothschild succeeded in secreting the money, and thus saved it from the hands of the French. At this time he had five sons, three of whom—Anselm, Nathan, and Solomon—being grown up, he associated with himself in business. ANSELM remained with him at Frankfurt. NATHAN came to England in 1800, where he acted as agent for his father, first at Manchester, in the purchase of Manchester goods for the Continent. He then removed to London, where by the agency of his father large sums of money were placed at his disposal, and invested by him with so much judgment that his capital multiplied with great rapidity. He was appointed, by the interest of the landgrave, agent for the payment of the £12,000,000 sterling which, by the treaty of Toeplitz, Great Britain stipulated to pay to her German allies. A large profit accrued to the house by this transaction. Previous to Rothschild's death (which occurred in Sept., 1812) he saw his five sons securely established as the monarchs of European finance—Anselm in Frankfurt, Nathan in London, Solomon in Vienna, James in Paris, and Charles in Naples; all united in the wealthiest copartnership of the present or probably any other age. Nathan, in London, is said to have known the result of the battle of Waterloo several hours before the English government, and the knowledge is said to have been worth £200,000 to him. The loans contracted by the firm during the great war with France were not more remarkable for their magnitude than their success. They never took a bad loan in hand, and hardly any good loans fell into other hands. In addition to their five principal establishments they have agencies in many other cities both of the old and new world. On two or three occasions the Rothschilds have successfully exerted themselves to preserve the peace of Europe. Their losses from the French revolution, in 1848, and from the depreciation in the funds and securities which followed the subsequent disturbances in various capitals of Europe, were estimated at the enormous figure of £8,000,000 sterling—a wild estimate, but proving the popular belief in the immense resources of the firm. Nathan, after his father's death, was considered the chief of the family. The emperor of Austria made him a baron of the empire in 1822. He died in 1836, at Frankfurt, whither he had been called by the marriage of his eldest son, Lionel, to his cousin Charlotte, daughter of the baron Charles. Anselm, Solomon, and Charles all died in 1855, the first-named dying childless at Frankfurt, and leaving a fortune valued at from 40,000,000 to 50,000,000 florins. James died in 1868.—Baron LIONEL DE ROTHSCHILD, eldest son, of Nathan, and head of the London house, was born in London in 1808, and educated at Göttingen. He was early initiated by his father into the business of the firm, and successfully applied himself to extend its colossal operations. He was elected for London in 1847, 1849, 1852, and 1857, and at each election claimed to take the oaths and his seat in the house of commons. The latter words of the oath—"on the true faith of a Christian"—he insisted upon omitting, "as not being binding on his conscience." He was then desired to withdraw from the house, and patiently awaited the fate of the bill of Jewish emancipation, which usually passed the commons, and was rejected by the upper house. In 1858 he was placed on a committee which was to hold a conference with the house of lords, and this was virtually the means of establishing Jewish emancipation. The commons sent up another bill, and a general belief prevailed that if it were, like the rest, thrown out by the lords, Jewish members would be admitted by resolution of their own house, instead of by act of parliament. The lords gave way, merely taking measures to prevent the admission of Jews into the upper chamber. Baron Rothschild thereupon (July, 1858) took the oaths and his seat. He sat till 1868, when he was rejected, but was re-elected in 1869; and lost his seat in 1874. He died June 3, 1879. His brother NATHAN, his son NATHANIEL, and other members of the Hebrew faith have also been elected to the house of commons. As the members of each successive generation are received into the copartnership, and the cousins usually

intermarry, and as their immense wealth is being continually augmented by a profitable business, the name and operations of the firm, as public-loan contractors, dealers in bullion, and bill-discounters, promise to last as long as some royal dynasties. It was this firm that, in 1875, supplied the £4,000,000 necessary for the purchase of the Suez canal shares.

ROTIFERA. See ROTATORIA.

ROTTECK, KARL VON, 1775-1840, b. Freiburg, Germany; educated for the bar, and a professor in the Freiburg university. He became interested in politics, joined the liberals, and wrote pamphlets against standing armies and on the powers of representative bodies. In 1819 he represented the university in the legislative council of the Baden states. He lost his professorship on account of his political opinions, but in 1840 was reappointed. His great work on the world's history, *Allgemeine Weltgeschichte*, was very popular in Germany, and has been translated into many languages.

ROTTEE, an island of the Malay archipelago, the southernmost island of Asia; 50 m. long, 20 m. wide; pop., 35,000. It lies at the s.w. extremity of Timor, and contains a Dutch settlement and the village of Rangong. The surface is mountainous and well timbered. Ebony and mahogany are found. The agricultural products are millet, maize, edible birds' nests, and honey. Much attention is paid to raising live stock, including buffalo.

ROTTENBURG, a t. in Württemberg, 7 m. s.w. from Tübingen, is situated on the Neckar. Pop. '75, 6,416. The castle, built in 1216, is now the house of correction. In the neighborhood are extensive hop-fields, orchards, and vineyards. The Roman station Sumelocennis stood on the site of Rottenburg, and remains of roads and viaducts have been found. Rottenburg is the seat of a bishop.

ROTTEN-STONE, a mineral consisting chiefly of alumina, with about 10 per cent of carbonaceous matter, and a little silica. It is supposed to be formed by decomposition of shale. It is found in Derbyshire, England, in Wales, and near Albany, in the state of New York. It is brown; either grayish, reddish, or blackish. It is soft, and easily scraped to powder, and is well-known to housewives, being much used for cleaning and polishing brass and other metals.

ROTTERDAM (*dam* or dike of the *Rotte*), after Amsterdam, the largest city in the Netherlands, and a place of great commercial activity, is situated at the confluence of the Rotte with the Maas, in the province of South Holland. It forms a triangle with the apex to the n., and the base stretching along the river, ships from all parts of the world discharging their cargoes in front of the Boompjes, a splendid row of houses shaded with trees. The Hoog straat, built on the dam or dike formed to repel inundations, divides the city into the Binnenstad and Buitenstad, the former being n. of that line, the latter extending southward to the Maas. Broad canals or havens, full of shipping, cut the Buitenstad into islands, and lofty houses face the quays on either side. The largest canals are the Leuvenhaven and Oudehaven, which trend inward from the Maas, and the Scheepmakershaven, Wijnhaven, Blaak, Haringvliet, and Nieuwhaven, parallel with the river. Rotterdam is rapidly extending in all directions. The population has more than doubled within 50 years, and on Jan. 1, 1872, it amounted to 123,677, or 58,411 males, and 65,266 females. On Dec. 31, 1874, the number had risen to 129,239, or 59,817 males, and 69,422 females. About two-thirds are Protestants, nearly one-third Roman Catholics, and 4,500 Jews.

The industries are varied, including sugar-refining, gin-distilling, the making of liqueurs, beer-brewing, iron-founding, soap-boiling, the manufacture of vinegar, cigars, patent oil, sail and hair cloths, articles of gold and silver, ship-building, etc. The works of the Netherlands steamboat company, at Feijnoord, employ 700 men. The shipping trade is extensive. In 1875 there cleared in 863 sailing vessels of 274,497 tons, and 2,572 steamships of 1,380,074. Of these, 277 sailing-ships and 1975 steamers were from British ports, representing 1,028,083 tons; and 43 sailing-ships from British colonies. A large traffic is carried on with Germany, Belgium, and the interior of the Netherlands.

Refined sugar is extensively exported. Large quantities of butter, cheese, yeast, madder, flax, and fruits are annually sent to Great Britain; also immense numbers of cattle, calves, swine, and sheep.

Rotterdam has railway communication with the other cities of the Netherlands, Germany, and Belgium. It is about 20 m. from the mouth of the Maas, the great commercial highway between the open sea and the Rhine provinces of Prussia. The municipal government consists of a burgomaster, 4 wethouders (aldermen or bailies), and 34 councilors. Rotterdam has 4 Dutch reformed churches, 1 French Protestant, 1 English Episcopal, 1 Scotch church, 6 Roman Catholic chapels, and 1 Jewish synagogue. The schools are good, and subsidized by the municipality. There are 3 for gymnastics; a normal school; one for training boys for sea; a medical school; an institute for the deaf and dumb, at which 93 boys, and 52 girls are educated by 15 teachers, 64 of the pupils being admitted free; a grammar school called the Erasmus; and several institutions for arts, sciences, architectural drawing, and music. The medical school has an anatomical museum; the Batavian society possesses a good collection of philosophical instruments, books, and models. The museum Boijmans, with many valuable paintings

and works of art, was destroyed by fire in 1863. The exchange, built in 1722, is a plain rectangular building of hewn stone. The hospital, on the Coolsingel, a handsome erection, with excellent internal arrangements, can receive 250 patients. Rotterdam has also a children's hospital, which is a great boon to the poor. The St. Laurence church, built at the end of the 15th c., is a spacious building, resting on 14 Gothic pillars, and ornamented with a high truncated tower, the top of which is reached by 326 steps. It has a splendid organ, and several beautiful marble monuments, in honor of De Witt, admiral Kortenaar, and other distinguished men. A bronze statue of Erasmus stands on the great market, and the house in which he was born is pointed out in the Breede Kerk straat, which leads to the great church. The city has been added to and improved, and the water-way to the sea deepened and altered (the works completed in 1872), so as to avoid, as far as possible, the hindrances to the navigation which are caused by the sand-banks at the mouth of the Maas.

ROTTI, an island in the Indian archipelago, belonging to the Dutch, lies to the s. w. of Timor, between 10° 39' and 10° 56' s. lat., and 122° 57' and 123° 29' e. long.; pop. 75,000. Its greatest length, from e. to w., is 36 m., and the breadth from Termano, on the n., to Tilly, on the s., about 11 miles. The surface, though hilly, is nowhere more than 600 ft. above the sea, and the fertile soil produces a rich vegetation.

The most valuable product is the lontar palm, the wine or juice of which, either used fresh or thickened by boiling, and preserved in pots, forms a leading article of food. Next in importance is the gabang tree, which bears large quantities of fruit, in size and shape like apricots, the fiber yielding a good tow, and the pith a sort of sago. Coconut, plantain, banana, and mango-trees are abundant. There is a great variety of timber trees, as beautiful ebony, mahogany, and several sorts well adapted for ship-building. The Rottinese plant millet, tobacco, rice, etc. Rotti is famed for a small but noble and hardy race of horses, which are bought for exportation at about £1 6s. each. There are many buffaloes, sheep, goats, swine, deer, fowls, etc. Edible nests, tripping tortoise-shell, and wax are articles of export. Horses, swine, palm-wine, syrup, sugar, and native sail-cloth are exported to Timor, and cotton fabrics, cotton, beads, iron, iron-work, powder, guns, and arrack received in exchange.

The Netherlands' missionary society have made considerable progress in Christianizing the natives, who are a fine-looking race, originally, it is thought, from Java. See *Land en Zeeogten in Nederlands Indië*, by Johannes Olivier; *Reis door den Indischen Archipel*, by L. J. van Ruijck.

ROTTLERA, a genus of trees of the natural order *euphorbiaceæ*, with a 3 to 5 parted calyx, no corolla, 30 to 40 stamens springing from the convex receptacle, and a 2 to 4 coccoous capsule, each portion having one seed. The species are rather small trees, found in India and other tropical parts of Asia. *R. tetraococa* grows in Sylhet, and yields a hard and valuable timber. *R. tinctoria* is a native of India, from the Coromandel coasts to the northern forests. Its capsules are covered with short stiff hairs, which, when rubbed off, have the appearance of a fine red powder, are used in India for dyeing silks scarlet and orange, and form an article of commerce in that country. Professor Anderson of Glasgow has examined this dye-stuff, and in the *Edinburgh Philosophical Journal* for April, 1855, has stated his opinion that it merits the attention of silk-dyers. The color which it yields is of great beauty and great stability.

ROTTWEIL, a small t. of Württemberg, on a declivity on the left bank of the upper Neckar, 38 m. e.n.e. of Freiburg in Baden. It contains a beautiful exchange, a number of interesting churches, and two powder-mills. Its manufactures are silk, cotton, and woolen fabrics, and its corn-market is one of the most important in the kingdom. Pop. 75, 5,547.

Rottweil is the site of an ancient Roman colony, among the ruins of which was discovered, besides a large number of other valuable antiquities, now preserved in the buildings of the gymnasium, a now well-known piece of mosaic work, upon which, among others, are an excellent drawing of Orpheus, and a number of profile drawings of the larger kinds of game, of chariot-races, and of gladiatorial encounters.

ROTUNDA, a building with circular exterior and interior, such as the Pantheon of Rome.

ROTURIER (according to Duncange, from *rupturarius*, a peasant; *ab agrum rumpendo*), one of the ignoble classes, who, during the early period of the feudal system, were separated from the high-born by almost as broad a line of demarkation as that which divided liberty from servitude. When the feudal theory of knight's-service came to be recognized as the only principle of gentle tenure, the term roturier came to be applied to the part of the population who continued to hold by the older or allodial tenure.

ROUARIE, ARMAND TAFFIN, Marquis de la, 1756-93; b. France; commissioned in the American army as col. He served under gen. Gates, and took part in the siege of Yorktown. He returned to France in 1784, and was subsequently at the head of a conspiracy against the republic of France for the benefit of the allied powers in the war, 1791, and in the interest of the exiled Bourbons.

ROUBAIX, a flourishing manufacturing t. in the n. of France, in the dep. of Nord, and 6 m. n.e. of Lille. It has risen into importance only in the present century. Numerous mills and factories, as well as dye-works and tanneries, are in operation. Roubaix rivals Elbeuf and Louviers for woolen cloths and carpets, and vies with Laval and the rest of Flanders in linen manufactures. Pop. '76, 74,946.

ROUBILIAC, LOUIS FRANÇOIS, 1695-1762; b. Lyons, France; educated in Paris, and settled in England, where he executed a statue of Shakespeare for Garrick which is now in the British museum, one of Newton, in Cambridge, and monuments to the duke of Argyll and to Handel for Westminster abbey.

ROUEN (Lat. *Rotomagus*), one of the principal manufacturing and trading cities of France, and the capital of the dep. of Seine-Inférieure, is situated on the right bank of the Seine, 87 m. n.w. of Paris by railway. The ramparts have been converted into spacious boulevards, which, as well as the quays that line the river-banks, are little, if anything, inferior to the boulevards and quays of Paris. The deep waters of the Seine form a commodious port, which is generally crowded with ships of all nations, from vessels of 300 tons to the smallest river craft. A stone bridge and a suspension-bridge connect the faubourg St. Sever, on the left bank of the river, with the city, which is at once one of the most picturesque and one of the busiest and liveliest places in France. Some of the streets are well and regularly built, with fine modern stone houses; but the greater part of Rouen consists of old, ill-built, but picturesque streets and squares, with tall, narrow, quaintly-carved, wooden-bound, and gabled houses. Among the many beautiful Gothic churches for which it is noted, the finest are the cathedral and the church of St. Ouen. The former, one of the noblest metropolitan churches of France, is a remarkably fine specimen of Gothic architecture. It is built in a cruciform shape, and has two towers at the sides of the w. entrance, and a lofty tower (464 ft. high) terminating in a cast-iron spire, which was erected after the destruction by fire in 1822 of the old wooden belfry, which bore the date of 1544. It was erected by Philippe Auguste between 1200 and 1220, and contains, in its 25 highly-ornamented chapels, numerous monuments of great interest, among others, those of duke Rollo of Normandy, and his son, William Long-Sword. The heart of Richard Cœur de Lion, buried in this church, is now preserved in the extensive museum of antiquities. The church of St. Ouen, as large as the cathedral, is one of the most interesting buildings in Rouen, and in its present restored state presents a pure and elegant specimen of Gothic architecture. Among the other buildings of Rouen, the finest are the palais de justice, belonging to the 15th c., and built for the parliament of the province; the hôtel de ville, with its public library of 110,000 volumes and its gallery of pictures; and the hôtel Dieu, one of the largest of its kind. Rouen has numerous benevolent, educational, and scientific institutions; and next to Lyons is perhaps the most important manufacturing town in the empire. The principal branches of industry are cotton manufactures, including the checked and striped cottons specially designated as *Rouenneries*, nankeens, dimity, lace, cotton velvets, shawls, etc. Rouen has also extensive manufactories of hosiery, mixed silk and wool fabrics, blankets, flannels, hats, cordage, cotton and linen yarns, shot, steel, lead, chemicals, paper, etc. Among other branches of industry, we may mention ship-building and machinery in various departments. Rouen is the seat of an archbishop, a high court of justice for the department, a tribunal of first instance, and of commerce, etc. Pop. '76, 104,863.

History.—As the original capital in France of the Northmen, who took possession of it in 842, and settled there in accordance with the agreement which Charles the simple was compelled to make with their leader Rollo, Rouen presents special points of interest to Englishmen. It was the residence of the dukes of Normandy till duke William, in 1066, on his conquest of England, transferred the seat of his court to London; and, till the time of Richard Cœur de Lion, it continued to be the capital of Normandy, and was the seat of government of the Norman possessions of William the conqueror's successors; but in 1204 it was taken by siege by the French king Philippe Auguste, and annexed with the main part of the duchy to the French crown. During the wars of Henry V. and Henry VI. of England, it was under the power of the English from 1419 to 1449, when it was retaken by the French under Charles VII. It was during this occupation by the English that Joan d'Arc was burned alive (1431) as a witch in the square of the city, in which stands her statue, and which is called, in memory of her, place de la Pucelle. Rouen was occupied by German troops in the war of 1870-71.

ROUGE, a preparation of safflower, used to give an artificial color to the checks, and, when properly prepared, said to be perfectly innocuous to those who use it. The color is obtained through a long and elaborate process, by precipitating it from the safflower, by means of citric acid or lemon-juice, on to prepared cotton. It is then washed out of the cotton with a solution of soda, and again precipitated with citric acid; but previous to adding the acid, finely-powdered French chalk is added to the solution, which becomes colored and falls down, when the precipitation takes place, giving the necessary body and a peculiarly silky luster to the coloring matter. *Jecceler's rouge* is a preparation of iron formed by calcining sulphate of iron, or green vitriol, until the water of crystallization is expelled; it is then roasted in a strong heat, and afterward

washed with water, until it no longer affects litmus paper. *Liquid rouge* is the red liquor left in making carmine.

ROUGE, OLIVIER CHARLES CAMILLE EMMANUEL, DE 1811-72; a French student of Egyptian monuments and hieroglyphics, professor of archaeology in the college of France, and associate-editor of the *Revue Archéologique*. His published works embrace discussions of nearly all the discoveries in Egypt from 1840 to 1869.

ROUGE CROIX, one of the pursuivants belonging to the heraldic establishment of England, generally allowed to be the most ancient, although the period of institution is uncertain. The title is derived from the red cross of St. George, the patron saint of England.

ROUGE DRAGON, the title of a pursuivance founded by Henry VII. on the day before his coronation. The name is taken from the supposed ensign of Cadwaladr, the last king of the Britons, ancestor of that monarch. The red dragon was also sometimes used by Henry VII. as a supporter.

ROUGE ET NOIR (Fr. "red and black"), **TRENTE-UN** ("thirty-one"), or **TRENT ET QUARANTE** ("thirty and forty"), is a modern game of chance, which is played by the aid of packs of cards on a table covered with green cloth. The table is divided into four portions, each marked in the center with a diamond, the diamonds being alternately red and black; and these quarters are further separated, two and two, by bands which cross the table at its narrowest part. At the end of the table are a series of concentric bands painted of a yellow color. The game is played as follows: one of the *tailleurs* (or dealers, who manage the table, take charge of the bank, and keep an eye on the players) takes up his position at one side of the table, opposite to the *croupier* (another *tailleur*), and unveils, in the presence of the players, six packs of cards, which are first counted, then shuffled by several *tailleurs*, and returned to the first *tailleur*, who presents them to one of the players to be cut. This is performed by the insertion of a blank card in any part of the pack, which is then adjusted, and the game proceeds. Each player must stake his money on some one of the four chances, denominated *noir*, *rouge*, *couleur*, and *l'inverse*, which will be afterward explained. After the stakes have been laid on the table (those for the *noir* being laid on either of the quarters marked with a *black*; and those for the *rouge*, on either of the quarters marked with a *red* diamond; those for the "*couleur*" on one of the transverse bands; and those for the "*inverse*" on one of the yellow circles at the end of the table), the *tailleur* takes a handful of cards from the top of the pack, and deals first for the *noir*, taking one card after another from the top of the handful and placing them on the table side by side, till the number of pips on them amounts to more than 30, when he stops. He then deals out another row in a similar manner for the *rouge*, till, as before, the number of pips amounts to more than 30. In reckoning the number of pips, the ace is counted as one, the other plain cards according to the number of pips, and the court-cards 10 each. It will thus be seen that the number to which each of the two rows of cards amounts, must be more than 30 and not more than 40. If the value of the first row is nearer 31 than that of the second, then the first row, or *noir*, wins, if the contrary is the case, then the second row, or *rouge* wins. *Couleur* wins if the first card tabled by the *tailleur* is of the winning color; thus, for instance, if the first card laid down is a "spade" or "club," and if *noir* wins; but if the first card dealt be not of the winning color, then *inverse* wins, and *couleur* loses. Two (and no more) of the four chances can be winning chances at one time; and the winning players have their stakes increased by an equal sum from the bank, and then withdraw their stake and winnings, while the stakes of the losers are raked by the *tailleurs* to the bank in the center of the table. When the value of the first, or *noir*-row, is equal to that of the second, or *rouge*-row, it is a *refait*, and the dealer must commence to deal anew from the cards remaining in his hand; when the *refait* occurs, the player may either withdraw his stake, or stake on a different chance, with the same or more or less money as he thinks proper. The game of *rouge et noir* would be an even one between the players and the bank, were it not for the following regulation: When the points dealt for the *noir* and the *rouge* each amount to 31 ("un *refait de trent-et-un*"), the half of all the stakes on each of the chances belongs to the bank, and this the players may either pay or have their stakes "put in prison," the next deal determining whether they shall belong to the bank or be restored to the player. If a second doublet of 31 occurs in the deal immediately succeeding, the stakes which were in prison are diminished by one-half, which goes to the bank, and the other half is "put into the second prison," from which it requires two successive winnings of the player to regain them. The chance of "un *refait de trent-et-un*" is about once in 64 deals.

This game superseded *faro* (q.v.) and *bribi* in France about 1789, but along with roulette (q.v.), was forbidden by law in 1838.

ROUGET, GEORGES, 1781-1869; contemporary of the painter David, and author of many celebrated pictures; among them are the "Death of St. Louis," "Henry IV. at the Siege of Paris," and a considerable number representing phases in the life, and at the court of Napoleon I.; including the coronation and the death of Napoleon.

ROUGH-CAST, a kind of coarse plaster mixed with gravel, which is applied to the exterior of walls to protect them from the weather. It is also called *harling* in Scotland, where it is much used.

ROUHER, EUGÈNE, a very eminent French statesman, was b. at Riom, on Nov. 30, 1814. He first distinguished himself as an advocate at the bar of his native town, at which he practiced up to 1848. The attention of the country was first drawn to him by the ability he showed in a press prosecution, in which he was engaged for the defense. In 1848 he was returned by the department of Puy-de-Dôme to the constituent assembly, which was summoned after the revolution of that year, and in the following year he was returned to the corps législatif by the same department. On the break-up of Odillon Barrot's cabinet, the first ministry of Louis Napoleon, toward the end of 1849, Rouher was appointed minister of justice; and with slight interruptions, he has been since then a member of the French government. In the corps législatif he showed himself a moderate politician; and he never affected to consider the republic an improvement on the constitutional system which had preceded it. In 1852 he was appointed vice-president of the council of state, with the oversight of the departments of legislation, justice, and foreign affairs. In 1855 he was appointed minister of agriculture, commerce, and public works, and in this office he found extraordinary opportunities for the exercise of his administrative ability. In the negotiation of the treaty of commerce with England, which—much decried both in France and in England at first—is now admitted to have conferred immense advantages upon both countries, the negotiations were conducted by M. Rouher and M. Baroche on the part of France, by lord Cowley and Mr. Cobden on the part of England; the treaty was signed on Jan. 22, 1860. The arrangements consequent upon the treaty involved immense labor and manipulation of details, and the chief part in adjusting them devolved upon M. Rouher and Mr. Cobden. In 1863 he negotiated a treaty of commerce between France and Italy, receiving from the king of Italy, in acknowledgment of his merits, the orders of St. Maurice and St. Lazaire. He has thus been the chief instrument in the introduction, or in preparing the way for the introduction, of free trade as the commercial policy of France and the neighboring continental countries.

In June, 1863, M. Rouher retired from the ministry of agriculture and commerce, and was appointed president of the council of state in succession to M. Baroche. Soon after, he took the office of minister of the interior; and in Oct., 1863, on the death of M. Billault, he was appointed minister of state. In this office he had to represent the government as "talking-minister" in the corps législatif; and it is admitted that he had no superior as a debater among the great orators trained under the constitutional system, and these were able rivals. His reputation as a debater stands as high as his reputation as an administrator; and it may safely be said that he has no superior, if any equal, for ability among the French politicians of the time. In Jan., 1867, when the late emperor, by a decree, introduced certain modifications of the privileges of the corps législatif, and of the relations between that body and the ministers, M. Rouher, with the other members of the cabinet, resigned office, but he was immediately reinstated in it. He was appointed a member of the French senate on June 18, 1856. He became grand officer of the legion of honor in 1856, and gained the grand cross in Jan., 1860. He was returned to the national assembly for Corsica in 1872.

ROULERS, a t. of w. Flanders, Belgium, 19 m. s.s.w. of Bruges. In the vicinity flax is extensively grown, and in the town linen is largely bleached and manufactured. Pop. '70, about 14,200.

ROULETTE (Fr. "a little wheel"), a game of chance which, from the end of last century till the beginning of 1838, reigned supreme over all others in Paris. It continued to be played at German watering-places till 1872, when it ceased in terms of an act passed four years before. Roulette is still played at Monaco, in Italy. As much as £8,000 a year used to be spent in the papers of Paris alone advertising this game, which is purely one of chance, and is played on a table of an oblong form, covered with green cloth, which has in its center a cavity, of a little more than two feet in diameter, in the shape of a punch-bowl. This cavity, which has several copper bands round its sides at equal distances from each other, has its sides fixed, but the bottom is movable round an axis placed in the center of the cavity; the handle by which motion is communicated being a species of cross or capstan of copper fixed on the upper extremity of the axis. Round the circumference of this movable bottom are 38 holes, painted in black and red alternately, with the first 36 numbers, and a single and double zero; and these 38 symbols are also figured at each end of the table in order that the players may place their stakes on the chance they select. Along the margin of the table and at each end of it are painted six words, *pair, passe, noir, impair, manque, rouge*, which will be afterward explained. Those who manage the table and keep the bank are called *tailleurs*. The game is played as follows: one of the *tailleurs* puts the movable bottom in motion by turning the cross with his forefinger, and at the same instant throws into the cavity an ivory ball in a direction opposite to the motion of the bottom; the ball makes several revolutions, and at last falls into one of the 38 holes above mentioned, the hole into which it falls determining the gain or loss of the players. A player may stake

his money on 1, 2, or any of the 38 numbers (including the zeros), and shows what number or numbers he selects by placing his stake upon them; if he has selected a number or zero corresponding to the one into which the ball falls, he receives from one of the tailleurs 36 times his stake—viz., his stake and 35 times more—if he selected only 1 number, 18 times if 2 numbers, 12 times if 3 numbers, etc. The blank rectangles at the bottom of each of the 3 columns of numbers figured on the table are for the reception of the stake of that player who selects a column (12 numbers) as his chance, and if the ball enters a hole the number of which is found in his column, he is paid 3 times his stake. Those who prefer staking their money on any of the chances marked on the edge of the table, if they win, receive double their stake (their stake and as much more), and under the following circumstances: the "pair" wins when the ball falls into a hole marked by an *even* number; the "impair," if the hole is marked *odd*; the "manque," if the hole is numbered from 1 to 18 *inclusive*; the "passe," if it is numbered from 19 to 36 *inclusive*; the "rouge," if it is colored *red*; and the "noir," if it is colored *black*. If the ball should fall into either of the holes marked with the single or the double zero, the stakes of those players who venture upon the 6 chances last described are either equally divided between the bank and the players, or, as is more commonly the case, they are "put in prison," as it is called, and the succeeding trial determines whether they are to be restored to the players or gained by the bank. Should it so happen that at this trial the ball again falls into one of the two holes (the chance against its occurring is 36 to 1) marked with zeros, then half of the stakes in prison are taken by the bank, and the remainder are "put into the second prison," and so on. The tailleurs thus have an advantage over the players in the proportion of 19 to 18. The player who bets upon the numbers labors under a similar disadvantage, for although the two zero-points do not affect him in the same way as the player who stakes upon one of the other 6 chances, still (supposing him to bet upon a single number) as the chances are 37 to 1 against him, he ought to receive 37 times his stake (besides the stake) when he does win, whereas he only receives 35 times that amount, a manifest advantage in favor of the bank in the proportion of 37 to 35.

ROUMA'NIA. See ROMANIA and MOLDAVIA.

ROUME'LIA (Turkish *Rumili*), a name used to denote an important portion of European Turkey, differing widely in area at various times, but most generally applied to the region between the Balkans and the Ægean, corresponding to the ancient Thrace and part of Macedonia.

ROUMELIA, EASTERN, a province of the Ottoman empire, lying immediately to the south of the Balkans. It is inhabited mainly by Bulgarians and Greeks, and though remaining under the direct military and political authority of the sultan, had administrative autonomy conferred on it by the Berlin congress of 1878. Internal order is maintained by a native gendarmerie and a local militia, the officers of which are appointed by the sultan; and the Porte retains the right of defending the frontiers by fortresses garrisoned by Turkish troops. The governor-general, nominated by the Porte, must be a Christian, and the constitution is settled by a European commission.

ROUND, in music, a short vocal composition, generally of a humorous character, in three or more parts, all written on the same clef. Each voice takes up the subject at a certain distance after the first has begun. The second voice begins the first part when the first begins the second part, and the third takes up the first part when the second begins the second part, the whole ending together at the mark of a pause, \curvearrowright , or a signal agreed on.

ROUND-FISH, *Coregonus quadrilateralis*, (see COREGONUS), a fish found in the western parts of North America, from Vancouver's Island northward, in the rivers on the western side of the Rocky mountains, and in the Mackenzie and Coppermine rivers. It ascends the rivers in summer to spawn, spending part of its life, like the salmon, in the sea. It is a beautiful fish; seldom more than two pounds in weight, of a yellowish-brown color, paler on the sides and belly than on the back, with bright and glittering scales, each of which is edged with a narrow band of dark gray; the mouth very small, no teeth perceptible. Before spawning, it is loaded with fat, which, on the shoulders, almost amounts to a hump; but after spawning, it becomes thin, and its flesh watery and insipid. In a good state, it is a very delicious fish, rivaling in excellence its congener, the whitefish (q. v.). This fish is an important article of food to the Indians of north-western America, and vast numbers are caught in the rivers as they ascend from the sea. They ascend in such numbers that no ordinary contrivances of fishing are necessary, but the fish are baled out by baskets, little nets, wooden bowls, or even by the hand. They are cured by splitting and drying, like salmon. The round-fish readily takes a rough gaudy fly.

ROUNDHEADS, a name given by the adherents of Charles I. during the English civil war, to the Puritans, or friends of the parliament, who distinguished themselves by having their hair closely cut, while the cavaliers wore theirs in long ringlets.

ROUNDLE, or **ROUNDLET**, in heraldry, a general name given to charges of a circular form, which, in English heraldry, have more special names indicative of their tinctures: the roundle or being, for example, called a *bezant*; and the roundle gules, a *tortoise*.

ROUND ROBIN, a name given to a protest or remonstrance signed by a number of persons in a circular form, so that no one shall be obliged to head the list. The round robin originated in France, and the name is derived from the words *round*, round, and *ruban*, a ribbon.

ROUND TABLE, KNIGHTS OF THE. See ARTHUR and NOVELS.

ROUND TOWERS. Tall narrow towers tapering gradually from the base to the summit, and found abundantly in Ireland, and occasionally in Scotland, are among the earliest and most remarkable relics of the ecclesiastical architecture of the British Islands. They have been the subject of endless conjecture and speculation among antiquaries, who have connected them with pagan times and pagan rites, but the controversies regarding them have to a certain extent been set at rest by the investigations of Dr. Petrie; and there can be now no doubt that they are the work of Christian architects, and built for religious purposes. They seem to have been in all cases attached to the immediate neighborhood of a church or monastery, and like other early church-towers (an older invention than bells), they served as symbols of dignity and power—while they were also capable of being used as strongholds, into which, in times of danger, the ecclesiastics, and perhaps the inhabitants of the country around, could retreat with their valuables. After the introduction of bells, they were also probably used as bell-towers. About 118 towers of this description are yet to be seen in Ireland—20 of which are entire or nearly so; and Scotland possesses three similar towers, at Brechin, Abernethy, and St. Eglisbay in Orkney. They are usually capped by a conical roof, and divided into stories, sometimes by yet existing floors of masonry, though oftener the floors have been of wood. Ladders were the means of communication from story to story. There is generally a small window on each story, and four windows immediately below the conical roof. The door is in nearly all cases a considerable height from the ground. The tower at Devenish, in Ireland, which may be considered as a typical example of the class, is 82 ft. in height, and furnished with a conical cap. A battlemented crown occasionally supplies the place of the conical roof, and in one instance the base of the tower is octagonal. Dr. Petrie is inclined to think that a few of these remarkable structures may be as old as the 6th c.; but this great antiquity has been questioned by later writers, particularly Dr. Daniel Wilson, who considers it not borne out by the character of the architectural details, and would assign them all to a period ranging from the 9th to the 12th centuries. The source whence this form of tower was derived, and the cause why it was so long persisted in by the Irish architects, are points which have not yet been cleared up. Two round towers, similar to the Irish type, are to be seen in the yet extant plan of the monastery of St. Gall in Switzerland, of the first half of the 9th c.; and, in the Latin description attached to the plan, they are said to be *ad universa superspicienda*. The church and towers as rebuilt at that date are no longer in existence; but the latter were probably introduced in honor of the founder of the monastery, who was the leader of a colony of Irish monks, who, early in the 6th c., carried civilization and religion into the fastnesses of the Alps. The form thus introduced became traditional in West Germany in the succeeding Romanesque style, where we have it reproduced with but little modification at Worms cathedral and elsewhere. See Dr. George Petrie's *Ecclesiastical Architecture of Ireland anterior to the Anglo-Norman Invasion* (Dublin, 1845); Dr. Daniel Wilson's *Prehistoric Annals of Scotland*.

ROJP, a Scotch legal term synonymous with auction (q. v.).

ROUSAY, or **ROWSA**, one of the Orkney islands, between the island of Westray on the n., and Pomona on the south. It is 4 m. long, 3 m. broad, is hilly, and covered with heath in the center, but has a margin of fertile land along the shore. Pop. '71 860.

ROUSE'S POINT, a village in n.e. New York, on the Ogdensburg and Lake Champlain railroad at the junction of the Grand Trunk and Central Vermont; pop. '70 about 2,000. It is at the n. extremity of lake Champlain, which at this point is crossed by a floating railroad bridge 5,000 ft long, constructed at a cost of \$300,000. It is $\frac{1}{2}$ m. s. of the Canada line, at the mouth of Richelieu river, and the customs receipts average \$500,000 annually. Printing is an important industry, and it contains a large publishing house in the international book-trade. The harbor is defended by fort Montgomery. Lumber is largely exported, employing an extensive fleet of vessels. The manufacture of tobacco pipes is among the industries.

ROUSSEAU, JEAN BAPTISTE, 1670-1740; b. Paris; son of a shoemaker, but received a liberal education, and wrote some poetical pieces which impressed marshal Tallard so favorably that he took him to England as his secretary. On his return to Paris he was admitted into the best society, and was much courted owing to his poetical fame. In 1712, however, he was prosecuted for being the author of some couplets in which the characters of several persons of wit and merit were blackened by the most atrocious calumnies. The scandal was so great that he was banished from France, to which he was never to return. But he always denied, even on his death-bed, his having been author of those satires. He went to Switzerland, accompanied prince Eugene to Vienna, and remained with him about 3 years. When he lost his favor by satirizing one of his mistresses he retired to Brussels, where he afterward usually resided. He gained a fortune by publishing his works in England, but lost it by placing it in the hands of the Ostend company.

ROUSSEAU, JEAN JACQUES, a French author, celebrated not less for the singularities of his character, and the misfortunes of his life, than for the brilliancy and sentimental enthusiasm of his writings, was born at Geneva June 28, 1712. The family to which he belonged was of French origin, but had been settled for more than a century and a half in the little republican city, where his father, Isaac Rousseau, was a watchmaker. Deprived of his mother before he was a year old, Rousseau's infancy was tenderly cared for by a sister of his father's. At the age of ten he was placed, along with a cousin, under the charge of a M. Lambercier, Protestant pastor of Bossey, near Geneva, with whom he remained two years. At fifteen a profession was chosen for him after considerable deliberation—that of *procureur* ("attorney"), and he was sent to a M. Masseron, to acquire a knowledge of engrossing, but that gentleman quickly dismissed him as a hopeless subject. In 1725 he was apprenticed to an engraver of Geneva, named Abel Ducommun, a harsh and violent man, from whose vulgar tyranny the sensitive and impulsive youth took refuge in flight (1728). Henceforth, to the end of his harassed and melancholy career, he was a wanderer; resting for a brief space in many homes, and making many friends, but always driven from the former, and robbed (or thinking himself robbed) of the latter. His first protector was a Mme. de Warens, in Savoy, by whose exertions he was placed at a charity-school in Turin. Here, however, he felt himself so miserable that he ran off, lived ambiguously for some time "with the wife of a soldier," but in spite of his "innocent passion" was very properly kicked out of doors by the irritated husband on his return; after which he became a lackey in the house of the countess of Verceili, where (as stated by himself in his *Confessions*) he stole a silk ribbon, and then accused a maid of the theft—in consequence of which both were dismissed. Finally, after certain vagabond adventures, he returned to his protectress, but again fell into irregular courses, whereupon Mme. de Warens conceived the amazing idea of rescuing the youth (who was now in his 21st year) from the temptations of vice by becoming his mistress herself. To preserve appearances, however, Rousseau always addressed her as *mamma*. In 1736 the two went to live at Charmettes, near Chambéry. Here Rousseau fell into a state of hypochondria, and went to Montpellier to place himself under medical treatment, but on his way thither fell in with a young lady whose charms quite dissipated all his morbid delusions. On his return he found that Mme. de Warens had consoled herself during his absence by another lover, whereupon he betook himself to Lyons, and lived as a house-tutor for three years. Thence he proceeded to Paris in the autumn of 1741—under the conviction that he had made certain grand improvements in musical notation (of which in fact he hardly knew the elements), and read a paper on the subject before the *académie des sciences*, but was told that his "improvements" were "neither new nor practicable." However, he managed to live here in an obscure way until he got the appointment of secretary to M. de Montaign, French ambassador at Venice. After a stay of 18 months in the city of islands, he returned to Paris, and finding his superior intolerable, became intimate with Diderot, Grimm, D'Holbach, and Mme. d'Épinay, the last of whom in 1756 provided a charming retreat for him in the vicinity of Paris, called the *Hermitage*, where he lived with a young girl of low origin, named Thérèse le Vasseur, who bore him five children, all of whom were sent by him to the foundling hospital—perhaps the most scandalous act of his strange life. Rousseau afterward married Thérèse, who seems to have been a faithful and affectionate creature of small capacity. The causes of his rupture with the clique of Parisian philosophers and fine women have been the subject of envenomed misrepresentation in France, but from the thorough and accurate researches of M. Morin (see *Essai sur la Vie et le Caractère de J. J. Rousseau*, Paris, 1751), it turns out that Rousseau was really the victim of an elaborate and odious conspiracy on the part of men who betrayed the confidence that he reposed in them. The conduct of Grimm was especially shocking. Driven from the *Hermitage* in 1757, he again found a temporary asylum with the duke and duchess of Luxembourg; but in 1762 he found it necessary to retire to Switzerland, and fixed himself at Motiers-Travers in Neuchâtel, where he obtained the protection of Marshal Keith, then governor of that Prussian province. The intrigues of his enemies pursued him even thither, and after certain paltry persecutions, lay and clerical, he accepted the offer of David Hume to visit England, where he arrived in 1766. Misunderstandings, however, ensued with the Scotch philosopher, and in the following year he returned to France, and was installed in the castle of Trye by the prince of Conti. He did not remain long there, nor did he enjoy peace. Calumnies of the grossest kind were circulated against him, and once more he sought security in precipitate flight. In 1770 he reappeared in Paris, where he lived in obscurity, but not in tranquillity, for eight years, when M. de Girardin offered him a refuge at his estate of Ermenonville, near the capital, in the beginning of 1778, and here the unhappy Rousseau died on July 2 of the same year.

Rousseau's personal character is a puzzle to moralists. There is no denying the vices and meannesses which stained it: these rest on the most unimpeachable testimony—his own. They are set forth with copious and melancholy sincerity in his *Confessions*, and the very incidents that lead us to condemn him most severely would never have been known to the world had he not chosen to reveal them. But he does not exculpate himself (as many suppose); on the contrary, he covers himself often with bitter and sad reproaches. On the whole, we are inclined to believe that he was, at bottom, an

honest, warm-hearted, humane creature—free from guile, but full of a feminine jealousy, aggravated by long persecutions into a species of insanity; volatile, but not faithless; an erring, but withal a lovable mortal. His grand defect was in strength of will. "A man in convulsions," says Carlyle, speaking of Rousseau (*Heroes and Hero-worship*), "is not strong, though six men cannot hold him;" and all through his spasmodic life, and the splendid sentimentalism of his writings, we are conscious of a "forceful feebleness," a want of genuine intellectual power and insight. His opinions in a philosophical point of view are valueless; men of any vigor or acuteness care nothing for his notions about the social contract—influential though they once were during that period of crazy enthusiasm and sham speculation, the French revolution—nor for his shallow panegyrics on the "savage state;" but when he paints the emotions of a tender and voluptuous love, the rose-colored charm of his genius is irresistible. The most famous of his productions are *Discours sur l'Origine et les Fondemens de l'Inégalité parmi les Hommes* (Amst. 1755); *Julie, ou la Nouvelle Héloïse* (1760); *Du Contrat Social, ou Principes du Droit Politique* (Amst. 1762); *Emile, ou de l'Éducation* (Amst. 1764); and *Les Confessions, suivies des Réveries d'un Promeneur Solitaire* (Geneva, 1782; posthumous); but besides these he wrote a vast number of miscellaneous essays, letters, and treatises. His *Œuvres Complètes* have gone through innumerable editions. See Morley's monograph (1873).

ROUSSEAU, LOVELL HARRISON, 1818-69, b. Ky.; his education was scanty; he studied law and in 1841 was admitted to the Indiana bar. In the Mexican war he was a capt. of volunteers, and was in the battle of Buena Vista. He practiced at Louisville, obtained a high position at the bar, and was a member of the state senate. In 1860 he sided with the unionists, raised two regiments of volunteers, and encamped them on the Indiana side of the river. In 1861 he was made brig. gen. of volunteers and had commands at the battles of Shiloh, Perryville, Stone River, Chattanooga, and Chickahominy. 1864 he was placed in command of the district of Tennessee, and made a dashing raid into Alabama, destroying the Atlanta and Montgomery lines of railroad. He was brevetted maj. gen. promoted to the rank of brig gen. in the regular army, and held commands in Alaska and New Orleans. In 1865 he was elected to congress from Kentucky.

ROUSSEAU, PHILIPPE, b. Paris. 1816; studied painting under Gros and Victor Bertin, and exhibited first in the salon of 1831. His works have been extremely popular, mostly landscapes, or paintings of a semi-rural character, or of animals, in amusing exhibitions of their peculiar natures. They have been extensively engraved, copied and imitated, and form originals for thousands of now common household pictures, and book illustrations. Among them are the "*Rat de Ville et le Rat des Champs*;" the *Loup et l'Agneau*; and many others illustrative of the fables of La Fontaine.

ROUSSEAU, THÉODORE, 1812-67; b. France; early among modern painters to separate a simple delineation of natural objects from associate objects intended to suggest some classic imitation or personal interest. The French salon was fully opened to him in 1849. In 1852, at the expositions of 1855 and 1869, his paintings received honors among the highest. He is considered almost the head of the realist school in landscape; and his character was as simple, grave, and thoroughly independent, as the forms of nature which he courted. Among his famous works were the *Allée de Châtaigniers*, bought by the khedive of Egypt, and a great number of scenes in the forest of Fontainebleau in which he lived.

ROUSSETTE. See **KALONG**.

ROUSSILLON, formerly a province of France, was bounded on the n. by Languedoc, on the e. by the Mediterranean, on the s. by the Pyrenees, and on the w. by the county of Foix. It now forms the French department of the Pyrénées Orientales. In ancient times the capital was *Ruscino*, which stood in the vicinity of Perpignan.

ROUT, one of the absurd names given to a fashionable evening assembly in London toward the end of the 18th and early part of the 19th centuries. At these entertainments as many as 2,000 to 3,000 ladies and gentlemen were invited, and when the apartments were not sufficiently spacious for the company, temporary rooms were erected in the rear of the house, and elegantly fitted up. Crowded assemblies of this kind are now known as "soirées," or "at homes." For an amusing account of them we refer to Mrs. Stone's *Chronicles of Fashion*, vol. ii. p. 262.

ROUVILLE, a co. in s.w. Quebec, Canada, bounded on the n.w. by the Richelieu river, drained by the Yamaska river, crossed by the Montreal, Chambly and Sorel, and the Stanstead, Shefford and Chambly railroads; about 250 sq. m.; pop. '71, 17,634. The surface is diversified. The soil is fertile. The principal productions are corn, wheat, and oats. Capital, Sainte Marie de Monnoir.

ROUX. The name of a material used by cooks to thicken soups and gravies; it is made either white or brown. The former is prepared by putting a quantity of butter into a well-tinned stew-pan, and dissolving it gently over the fire. It is kept over the fire until it begins to simmer, when fine flour is dusted in with a dredge, and carefully incorporated, the flour being added until it is sufficiently thickened. It is then poured into a jar, and is ready for use. The brown is made in the same way, except that it is kept a longer time over the fire, which gradually gives it a rich brown color.

ROVE BEETLE, or **COCKTAIL**, *Staphylinus*, a genus of coleopterous insects, the type of a family, *staphylinidae*, to very many of which the same English names are often extended; belonging to the section *coleoptera pentamera*, and tribe *brachelytra*, of which a chief characteristic is the short square elytra, which leave the greater part of the abdomen exposed. The abdomen is soft and flexible, and these insects have a habit of turning up the point of it, particularly when annoyed, whence the name *cocktail*. They feed on carrion; their larvæ, however, not unfrequently choose vegetable food, as young wheat, cutting the stem underground with their strong mandibles. The bite of some of the species is apt to cause bad sores. The species are numerous. Many of them have a fetid odor; a few have odors resembling those of fruits and flowers.

ROVEREDO, a city of Austria, in the Tyrol, occupies a most beautiful and picturesque site in the Lagerthal, on the banks of the Leno, and close to the left bank of the Adige, 12 m. s. of Trient by railway. Roveredo, one of the most flourishing towns in the Tyrol, is the center of the silk-trade. It contains 60 factories, in which 2,300 hands are employed, and carries on besides some trade in wine and an active transit-trade. Pop. '69, 9,063. Roveredo was the scene of a battle between the French and Austrians on Sept. 3 and 4, 1796, in which the latter were defeated.

ROVIGNO, a trading-t. and seaport of Istria, stands on a rocky promontory which forms a double harbor 45 m.s. of Trieste. The best Istrian wine is grown in the vicinity, which is also abundantly productive in oil: 30,000 casks of olive oil are exported annually; and ship-building, the usual manufactures to which a seaport gives rise, and the tunny and sardine fisheries are the chief branches of industry. Pop. '69, 9,564.

ROVIGO, a province in n.e. Italy, bounded by the Adriatic and by Padua, Venice, Verona, Mantua, and Ferrara; traversed by the Po and the Adige; about 650 sq.m.; pop. about 200,000. The surface is somewhat irregular. The soil is fertile. The principal productions are corn, wheat, wool, flax, hemp, and silk. Capital, Rovigo.

ROVIGO, a city in Italy, capital of the province of the same name, on the Adigetto, 38 m. s.w. of Venice. It is a handsome fortified city; has a cathedral, which contains some fine paintings, and a picture-gallery. The staple produce of the neighborhood is grain and wine. Pop. 7,500.

ROVING. See **SPINNING**.

ROVUMA, a river of s.e. Africa, which enters the Indian ocean by a spacious bay n. of cape Delgado. Only a small portion near its mouth was known to Europeans till 1861, when Drs. Livingstone and Kirk attempted its ascent in the small steamer *Pioneer*, drawing five feet water. The river was then in flood, and had a strong current. After an ascent of 30 m. the difficulties of the passage induced the explorers to return. Another ascent was made by the same party during the dry season of 1862. With two ship's boats they reached the rapids which limit the navigation, above 100 m. from the coast, and half way to the Nyassa lake.

Passing through gloomy, unhealthy forests of mangroves, they entered a healthy plain, covered with heavy timber and brilliantly flaming tropical plants; but the country was infested by the "tsetse fly," a serious obstacle to its development. The river abounded with hippopotami. The travelers came within two days of the town of N'gomano, where all the caravans cross the Rovuma, but could not leave the boats in order to reach it. Here the Rovuma is joined by the Niende, a large affluent from the hills on the s.w.; while the main stream comes from the w. and n.w. As the Rovuma is navigable for only a few months of the year, it offers little advantage for commerce; but it affords an excellent entrance by which to explore the regions between the Nyassa and Tanganyika lakes. During his last African journey Dr. Livingstone and his party left Zanzibar in Mar., 1866. Owing to the swampy state of the country the party landed 25 m. n. of the Rovuma, and striking s.s.w. across the country to that river, followed it to the point where it is joined by the Leonde from the mountains on the s.w., near the eastern shore of lake Nyassa. On their arrival at N'gomano, the travelers found the country destitute of provisions, a tribe of Mazité having swept away all the food found above ground. Dr. Livingstone proposed to establish the base of his operations at N'gomano till he could find his way round the Nyassa; and the last authentic news of him received for a long time was from a letter dated thence on the 18th May, 1866. See **LIVINGSTONE** for the proceedings of that great traveler from the time he was at N'gomano till his death in 1873.

ROWAN', a co. in n.e. Kentucky; drained by the Licking river, its s.w. boundary, and by Triplett creek; 370 sq.m.; pop. '80, 4,419—4,398 of American birth; 105 colored. Surface hilly, and heavily wooded; corn, wheat, grass, and pork, are the chief products. Cattle raising is extensively carried on. Co. seat, Morehead.

ROWAN', a co. in central North Carolina; drained by the Yadkin and smaller rivers; traversed by the North Carolina railroad and its western branch; 550 sq.m.; pop. '80, 19,917—19,876 of American birth; 6,306 colored. The surface is hilly and not very fertile; corn, tobacco, wheat, oats, and pork are the staples. Granite is found. Co. seat, Salisbury.

ROWAN, JOHN, 1773-1843; b. Penn., removed with his parents to Kentucky in 1783. His early studies were directed by Dr. Priestley at Bardstown; he was admitted to the bar 1795. In 1799 he was a delegate to the state constitutional convention, secretary of state 1804; member of congress 1807-09. He was a member of the state legislature for a number of years; judge of the court of appeals; U. S. senator 1825-31. He was unrivaled in his state as a pleader in criminal cases, and by his eloquence compelled conviction in debate, as in the court room.

ROWAN, STEPHEN C., b. Ireland, 1808; entered the U. S. navy as midshipman 1826, rose through successive grades to rear-admiral 1866. He was prominent in the battle of Niesia, upper California; at the bombardment of Guaymas, in command of the *Cyane*; and in the war of the rebellion in command of the *Paucnee* at Acquia creek, and in the capture of Hatteras. He commanded the small fleet in the attack on Roanoke island, and in Albemarle sound his command assisted in the destruction of the confederate fleet, and took part in the victories in North Carolina. In Charleston harbor he commanded *The New Ironsides*; and was assigned to the command of the Asiatic squadron 1868-69. For valor and service he was made vice-admiral 1870.

ROWAN TREE, MOUNTAIN ASH, OR QUICKEN TREE, *Pyrus aucuparia* (*Sorbus aucuparia* of many botanists), a tree abundant in Britain, especially in the highlands of Scotland, and in many parts of continental Europe. It does not attain a great size, has in general a very straight erect stem, and is distinguished from the other species of *pyrus* (q. v.) by pinnated glabrous leaves, terminated by a single leaflet, serrated leaflets, corymbs of small flowers, and small globose fruit. The wood is valued for its compactness. The inner bark and sapwood have a very peculiar smell. In the superstitions of the Scottish highlands, and also of the lowlands, a peculiar importance was assigned to the rowan tree, a mere twig of which was supposed to have great efficacy in scaring away evil spirits. It is very ornamental, especially when in fruit. The fruit (*rowan berries*) is sometimes used for preserves. It has much acidity and a peculiar bitterness. It is generally red but there is a variety with yellow fruit; and a very nearly allied species, *P. Americana*, a native of North America, has purple fruit.

ROWE, ELIZABETH, 1674-1737; b. Ilchester, England. She was distinguished for her elegant writings, personal accomplishments, and benevolence. She published *Poems on Several Occasions, by Phulomela; Letters, Moral and Entertaining in Prose and Verse; Joseph, a Poem; Friendship in Death; Devout Exercises of the Heart*, published by Dr. Isaac Watts after her death. *Miscellaneous Works in Prose and Verse*, 2 vols.

ROWE, NICHOLAS, a dramatic poet and translator, the contemporary and friend of Congreve, Addison, Steele, and the other wits of the queen Anne period, was the son of a sergeant-at-law, and was born at little Barford, in Derbyshire, in 1673. He was educated at Westminster, and studied law in the middle temple; but inheriting a small competency by the death of his father, he devoted himself to literature. Between 1700 and 1714 he produced eight plays, of which three were long popular, viz.—*Tamerlane*, 1702; *The Fair Penitent*, 1703; and *Jane Shore*, 1714. The character of Lothario in the *Fair Penitent* was the prototype of Lovelace in Richardson's *Clarissa Harlowe*, and the name is still the synonym for an accomplished rake. Rowe translated Lucan's *Pharsalia*, and his translation was so highly valued that after his death his widow received a pension expressly on account of this service to literature rendered by her husband. He was also the first editor of Shakespeare, 1709. The popular talents and engaging manners of Rowe procured him many friends, and he was appointed to several lucrative offices. The duke of Queensberry made him his under-secretary of state. In 1715 he succeeded Tate as poet-laureate, and the same year he was appointed one of the land-surveyors of the customs of the port of London; the prince of Wales made him clerk of his council; and the lord chancellor Parker created him clerk of the presentations. He died Dec. 6, 1718, and was buried in Westminster abbey. As a dramatist, Rowe is characterized by an easy and elegant style of diction and versification, but is destitute of originality, subtlety, or force in the delineation of character or passion. In the construction of his dramas, "there is not," as Johnson remarks, "much art;" but there is no gross violation of taste or decorum, and he excels in scenes of domestic tenderness.

ROWING (BOATING, ante). The history of rowing as a pastime in the colleges of the United States began at Yale in 1843 and at Harvard in 1844, and the first intercollegiate boat-race took place on Aug. 3, 1852, on Lake Winipiseogee, N. H. It was in eight-oared barges, carrying coxswains, over a two-mile course, and was won by Harvard, being two lengths ahead at the finish. In 1855 Harvard was again victorious over Yale. This race took place on the Connecticut river near Springfield, over a three-mile course. The next race occurred in 1859 at lake Quinsigamond, near Worcester, Mass., between Harvard, Yale, and Brown, in six-oared shells over a three-mile course, and was won by Harvard in 19 minutes and 18 seconds. But on the day following Harvard was beaten by Yale by 2 seconds in a regatta thrown open by the citizens of Worcester. In 1860, in a race over the same course, Harvard won in 18 minutes 53 seconds. The war interrupted these races till 1864, when Yale beat Harvard at lake Quinsigamond, repeating the victory in 1865; but was beaten by Harvard over the same course five years in succession, 1866-70. In 1868 Harvard rowed the three miles in 17 minutes 43½ seconds, and in 1869

rowed on the Thames against an Oxford four-oared crew and coxswain, but was beaten by $1\frac{1}{2}$ length, being compelled on the day of the race to supply the places of two of her best men with substitutes. In 1871 an intercollegiate three mile race took place on the Connecticut river near Springfield between Harvard, Brown, and the Amherst agricultural crew, and was won by the latter in 16 minutes 47 seconds. In 1872 six colleges participated in this race, and it was won by Amherst in 16 minutes 33 seconds. In 1873 there were 11 colleges, Yale coming in ahead of all the rest in 16 minutes 50 seconds. In 1874 the intercollegiate race was rowed between 9 colleges on Saratoga lake, and was won by Columbia in 16 minutes $32\frac{1}{2}$ seconds. In 1875 there were 10 colleges competing, and Cornell won the race in 16 minutes $53\frac{1}{4}$ seconds, with Columbia second, Harvard third. On July 19, 1876, the last of these races took place at Saratoga lake. Only 6 colleges participated, and it was won by Cornell in 17 minutes $1\frac{1}{2}$ seconds, with Harvard second, Columbia third. Previous to this Yale and Harvard returned in a measure to the methods of 1854. In their race of that year, which was held June 30, 1876, Yale rowed over the course in 22 minutes 2 seconds, with Harvard 13 lengths behind. In the intercollegiate contest of the centennial regatta at Philadelphia the race was won by Yale in $9:10\frac{1}{4}$, with Columbia second, $9:21$; the Cambridge crew came in last, having thrown up their oars half a mile from the finish, owing to the illness of their captain. It was rowed Sept. 1 on the Schuylkill, $1\frac{1}{2}$ m. from the Falls bridge to Rockland landing. The international race for four-oared shells was rowed over the same course, and was begun on Aug. 28, 1876. In this race the crews rowed in batches of two and three, there being seven of these preliminary heats. In the first the Atlantis withdrew, and the Dublin university men were beaten by the Eurekas of Newark, N. J. The winners of the seven heats and the time made were as follows: Eureka, $9:29\frac{1}{2}$; Yale, $9:23\frac{1}{2}$; Columbia, $9:11$; Beaverwyck, $9:14$; Watkins, $9:6\frac{1}{4}$; London, $8:55$; Cambridge, $9:6\frac{1}{4}$. In the three heats of Aug. 29, between the winners of the day previous, the victors were London, $8:51\frac{1}{2}$; Watkins, $9:13\frac{1}{4}$, and Beaverwyck, $9:7$. Yale was beaten only by half a length by the four of the London rowing club (considered the first rowing organization in the world), and made the best time for American four-oared boats in the regatta, $8:52\frac{1}{4}$. The result of the final heat was a great surprise, the Beaverwycks of Albany beating the London crew by a quarter of a length, with Watkins only three lengths behind, in the comparatively slow time of 9 6. This was $14\frac{3}{4}$ seconds slower than London, and $13\frac{3}{4}$ seconds slower than Yale made in their contest the day previous. On Sept. 4 the London won a race against a New York crew over the same course, rounding the stake-boats, and returning to the start, making a distance of three miles. The time of London was $18:21\frac{1}{2}$; New York, $18:37$. In a second race on the same day the Paris crew of St. John's, N. B., who won the championship of the world on the Seine in 1867, were badly beaten by a raw crew of Halifax fishermen, who rowed over the same course in $17:58$. In 1877 Harvard won a race against Columbia, and in the four-mile race at New London Harvard won in $24:36$; Yale, $24:43$. In 1878, over the same course, Harvard won in $20:44$; Yale, $21:29$, but was beaten at Lake Owasco by Cornell, $17:13\frac{1}{2}$; Harvard, $17:27\frac{1}{4}$. In the same year Columbia sent a crew to England to compete for the Visitors' challenge cup, consisting of J. T. Goodwin, C. Edson, H. E. Fidahook, E. E. Sage, and Mr. Eldridge as substitute. The Shoewaccamettes, a Michigan crew, crossed the ocean to compete for the Steward's challenge cup. On the first day each American crew won a heat. In the final heat for the Visitors' challenge cup on July 5, 1878, the Columbia crew won easily in $8:41$; but the Michigan crew was beaten by the London rowing club in $8:26$, the Shoewaccamettes being compelled to stop before the finish, on account of the sickness of Joseph Nadeau. In 1879 Columbia won the college regatta at lake George, but was beaten at Philadelphia. The race at New London was easily won by Harvard in $22:15$. In 1880 Yale won the race over the same course in $24:27$; Harvard, $25:9$. The second annual regatta on the Schuylkill river was won by Columbia in $9:43$ against the crews of Princeton and the university of Pennsylvania; but the two-mile freshman race at New London was won by Harvard in $11:32$; Columbia, $11:37$. The Atlanta boat club was organized in 1848, and at the present time there are over 400 rowing organizations in the United States. In 1879 Edward Hanlan beat Elliott on June 16, and Charles Courtney on Oct. 16. In 1880 Hanlan beat Courtney in a five-mile race in 36 minutes 46 seconds on May 19, and won a race with James Riley for the same distance in 36 minutes $2\frac{2}{10}$ seconds on May 26. He was beaten in a race with Wallace Ross June 17, but beat Trickett Nov. 15. Trickett was also beaten by Wallace Ross Dec. 4.

ROWLANDSON, MARY (WHITE), b. Mass., 1636; married the rev. Joseph Rowlandson, minister, of Lancaster. In 1676 the Indians attacked and burned that town, and carried off her and her children, who were ransomed by some ladies in Boston, after a captivity of about 3 months. In 1682 she published a narrative of her captivity.

ROWLEY, WILLIAM, b. England, in the 17th c.; educated at Cambridge. He was a member of the royal company of players, and an excellent comic actor. He published a number of comedies of his own, and others in connection with Middleton, Heywood, and Massinger.

ROWSON, SUSANNA (HASWELL), 1762-1824; b. England; her childhood was spent in New England, but her father, a former British naval officer, returned to England on

the outbreak of the revolution. Susanna became an actress, came to America in 1793, played at Boston with great success, taught school for several years, and published several dramas and operas and a long series of novels, of which *Charlotte Temple* became highly popular, and is the only one now read.

ROXBURGH, a co. in Scotland, comprising the districts of Teviotdale and Liddesdale, with part of Tweeddale, extending in length about 40 m., and in breadth 28 to 30 m., is bounded on the e. and s. by Northumberland and Cumberland; on the s.w. by Dumfriesshire; on the w. by Selkirk; and on the n. by Berwickshire. The physical aspect of the county is varied and picturesque, having the Cheviot and Lauriston hills bounding a considerable portion of its borders. The Cheviots do not rise to any great height, the highest not exceeding 2,000 feet. The herbage is green to the summit, and affords valuable pasture to sheep. The interior of the county is generally composed of good soil; and the farms being mostly large, and held by men of capital and skill, it is farmed to the greatest advantage. The chief river is the Tweed, which flows through the northern districts of the county. The Teviot runs through the county a distance of 40 m., and falls into the Tweed at Kelso. There are several other streams of note, the Allan, the Slitrig, the Jed, the Gala, etc.

Roxburgh possesses an interesting history in connection with border feuds of former days; and it has many magnificent remains of monastic life and institutions, which, with its many legends and traditional stories, render it of much interest.

The proprietors are not numerous—the dukes of Roxburghe and Buccleuch, the marquis of Lothian, the earl of Minto, and a few others holding a great proportion of it. The area is 670 sq. m., or 428,494 acres. To the eye of a traveler Roxburgh is the county of Perth in miniature. The valued rent of it in 1674 was £26,222 sterling; the new valuation for 1875-76 was £420,161, including railways. In 1876 the total acreage under all kinds of crops, bare fallow, and grass, was 174,525; there was of wheat, 1165 acres; of barley, 16,456; of oats, 32,737; rye, 124; beans, 520; peas, 75. The total number of acres under corn crops was 51,077. The parliamentary constituency in 1875-76 was 1860. Pop. '61, 54,119; '71, 53,065. The county town is Jedburg.

ROXBURGHE CLUB, a society of very considerable literary interest, called after John, duke of Roxburghe, the celebrated collector of ancient literature. After the death of the duke, who died in 1805, his valuable library, rich in the old romances of chivalry and early English poetry—a very fine treasury in its way—was, in 1812, brought to that hammer which almost always in an unmerciful manner scatters the gatherings of book-collectors, and the large prices realized for some of the books were unprecedented. As a specimen, it may be stated that a copy of the first work printed by Caxton in 1471, the *Recuyell of the Histories of Troye*, sold for £1050 10s. The largest sum, however (and perhaps the greatest ever paid for a single printed volume up till that time), was given by the marquis of Blandford (afterward duke of Marlborough) for the first edition of Boccaccio's *Decameron*, which fetched £2,260. In commemoration of the interest which the sale of this collection occasioned among literary antiquaries, the Roxburghe club was instituted, for the purpose of printing a limited number of impressions of MSS. and rare works for the use of its members, to whom they are strictly limited. The Roxburghe club has in this way issued upward of 80 very curious and interesting works, which are only, however, to be found in the collections of the members, or in a few of the larger public libraries. On the anniversary (June 17) of the sale of the copy of Boccaccio's *Decameron*, above referred to, the club holds a symposium in London.

The Roxburghe club may be regarded as the parent of many literary societies subsequently founded for similar purposes, among which may be mentioned the Camden, Percy, Shakespeare, Chatham, Wharton, and Surtees societies in England; the Bannatyne, Maitland, Abbotsford, and Spalding clubs in Scotland; and the Celtic society in Ireland. The labors of these bodies in printing MSS. and fugitive black-letter tracts have added many important contributions to British literature.

ROXBURGHIA CÆÆ, a natural order of plants, belonging to the dictyogens (q.v.) of Lindley, twining shrubs with reticulated leathery leaves; and large, showy, solitary, fetid flowers; the perianth of 4 divisions, the stamens 4, hypogynous, the ovary 1-celled, the ovules numerous; the pericarp 1-celled, 2-valved, with 2 clusters of seeds at the base; the seeds attached to long cords. The species are very few, natives of the hotter parts of the East Indies. The stems of *Roxburghia viridiflora*, a native of Chittagong, the Malayan islands, etc., are sometimes 100 fathoms long. The roots are boiled and soaked in lime-water to remove their acidity, and are then preserved in syrup, and eaten.

ROXBURY, formerly a separate city of Massachusetts, but now incorporated with Boston, built upon hills and in hollows, which give it fine building sites and attractive scenery. Besides numerous elegant residences, churches, schools, banks, and newspapers, it contains many forges, steam-engine and boiler factories, cordage-mills, and manufactories of cotton, wool, carpets, flax-cotton, organs, starch, glue, etc. Pop. '70, 34,772.

ROXBURY (*ante*), on the Boston and Providence railroad, and now known as Boston Highlands, is about 3 m. s. of Boston proper, with which it is connected by

"Boston Neck." It occupies an irregular and picturesque surface, some of which commands a good view of the city proper. It is a favorite place of residence, and contains many handsome villas and residences, a large portion of which are surrounded by spacious lawns, gardens, and by shrubbery. It has about 40 churches, 4 banks, 2 newspapers, several Roman Catholic reformatory institutions, and a lunatic asylum. The manufacturing industries are extensive, including great breweries, foundries, tanneries, the extensive works of the Whittier machine company, beef-packing establishment, manufactories of locomotives, fire-engines, watches, soap and candles, phosphates, etc. On the Dedham turnpike lies the Forest Hills cemetery, comprising some 150 acres, beautifully laid out, and entered through an Egyptian gateway. Roxbury was settled in 1629, and included among its early inhabitants John Eliot and gov. Joseph Dudley. It was the birthplace of gens. Joseph Warren and Heath. In 1775 it was the site of a fort built by the Rhode Island troops, which did considerable damage to the British in Boston, and was called by Washington the best within the lines of siege. The Roxbury Latin school, established in 1642, endowed by Thomas Bell in 1645, has a high reputation. Roxbury received a city charter in 1346, and was annexed to Boston in 1868.

ROY, WILLIAM, Maj.gen. in the British army, was born May 4, 1706, at Milton Head, in the parish of Carlisle, Lanarkshire. His early history is quite unknown, and the incidents of his professional career comparatively unimportant, but his name will always be remembered by succeeding generations as that of the first of British geodesists. After the great rebellion in 1745, he was employed in preparing for government a map of the Highlands, and finally of the whole mainland, which, however, owing to imperfect instruments, and the hurried nature of the survey, was only, to use Roy's own words, "a magnificent military sketch." Roy's next important operation was the measuring a base line (see **ORDNANCE SURVEY**) on Hounslow Heath, of 27,404½ ft., or about 5½ m., which, though the first measurement of the kind in Britain which pretended to accuracy, was executed with such care, that, on being remeasured after Roy's death, the difference between the two results was found to be only 2½ inches. For this splendid labor, Roy received the royal society's Copley medal. Roy's labors connected with the survey extended from July, 1787, till Sept., 1788, when he returned to London in ill health, which necessitated his removal to the warmer latitude of Lisbon in the winter of 1789; but he returned to London in the following April, and died there July 1, 1790. In 1767 Roy was elected a fellow of the Royal society, to whose *Transactions* he contributed, in 1777, a paper entitled "Experiments and Observations made in Britain, in order to obtain a Rule for Measuring Heights with the Barometer." He had also, during his survey of Scotland, paid particular attention to the camps and other Roman remains in that country, and had completed an elaborate work on this subject, illustrated by drawings and plans, and by a copy of his map of the country. This work was published (1793) by the society of antiquaries (of which Roy had been a member), to whom it had been presented by Roy's executors. Roy was also surveyor-general of the coasts of Great Britain.

ROYAL ACADEMY OF MUSIC, an institution founded in 1823, by a number of musical amateurs, headed by the earl of Westmoreland, for the purpose of affording to a certain number of pupils the opportunity of obtaining a first-rate musical education, and of enabling those who make music a pursuit to provide themselves with the means of honorable livelihood. The academy is chiefly supported by contributions and subscriptions, the subscribers and contributors being divided into four classes, of whom the first three recommend and elect the students. A small sum is voted yearly by parliament for its maintenance. Of the scholars, some are boarders and some out-door pupils. The pupils are placed under the tuition of chosen instructors in every branch of musical education. The academy was incorporated by royal charter in 1830. Since its foundation, a number of its pupils have gone forth to the world as musicians of eminence, including among others Sir W. Sterndale Bennett, Messrs. G. A. Macfarren (who is now principal of the academy), A. Sullivan, Blagrove, Brinley Richards, Mme. Sainton-Dolby, Miss Loder, etc. Concerts are given by the pupils, to which the public are admitted. See Cazalet's *History of the Royal Academy of Music* (Lond., 1854).

ROYAL ASSENT. See **PARLIAMENT.**

ROYAL FAMILY. In its more restricted signification, the royal family of Great Britain only includes the queen-consort and queen-dowager, and the children or other descendants of the sovereign. In a larger sense, it comprehends all the British descendants of the royal house, or perhaps, more properly, as indicated by Blackstone, all who may by possibility succeed to the throne. With regard to the position and rights of a queen-consort and queen-dowager, see **QUEEN.** The husband of the queen-regnant is not as such a member of the royal family; but the style of royal highness, and a precedence next to her majesty, were conferred on the late prince-consort by statute. The prince of Wales (q.v.) or heir-apparent to the throne, and the princess of Wales, are distinguished by law from the rest of the royal family. By the statute 25 Edw. III., to compass the death of the prince of Wales, or violate the chastity of the princess of Wales, is high treason. The eldest daughter of the sovereign is styled the princess royal, and the violation of her chastity is, by the same statute, high treason. The heir-

presumptive to the throne has no special rank or precedence as such, as his position may be altered by the birth of an heir-apparent.

The younger sons and daughters of the sovereign are entitled to a peculiar place in the house of lords; statute 31 Henry VIII. c. 10 enacts that no person except the king's children shall presume to sit or have place at the side of the cloth of estate in the parliament chamber. On a reference by George II. to the house of lords regarding the position and precedence of Edward duke of York, second son of his son Frederick prince of Wales, it was held that, under the description of the king's children, grandsons are included.

On a reference made to all the judges by George I., it was resolved that the education and care of the king's grandchildren, when minors, and also the approval of their marriages, belongs to the king, even during their father's lifetime. This care and approval has more recently been held to extend to the heir-presumptive, and it is difficult to say how far it comprises also the remoter branches of the royal house. There are frequent instances of the crown's interposition in the case of nephews and nieces, and a few in the case of more distant collaterals. Questions regarding the marriages of the royal family are now further regulated by the royal marriage act (q.v.). The prince of Wales, besides the revenues of the duchy of Cornwall, has settled on him, by 26 Vict. c. 1, an annuity of £40,000, and the princess of Wales £10,000, to be increased to £30,000 in case of her widowhood.

On the consolidated fund are charged £25,000 to the duke of Edinburgh, £25,000 to the duke of Connaught, £15,000 to prince Leopold, £8,000 to the crown princess of Prussia (till 1879, £6,000 to the grand-duchess of Hesse), £6,000 to princess Christian of Sleswick-Holstein, £6,000 to the marchioness of Lorne, £6,000 to the duchess of Cambridge, £3,000 to her daughter, the grand-duchess of Mecklenburg-Strelitz, £12,000 to the duke of Cambridge, and £5,000 to princess Teck, formerly princess Mary of Cambridge.

ROYAL GEORGE, a British man-of-war, of 108 guns, the sudden sinking of which in Portsmouth harbor with all on board, Aug. 29, 1782, created a wide-spread feeling of sorrow and commiseration. The *Royal George* was the principal vessel of lord Howe's fleet, and while she was undergoing repairs near the keel, she was too much heeled over, so that the water rushing through the port-holes of the depressed side, speedily filled her, and she sank with all on board, including the admiral, Kempenfeldt, the captain, officers, crew, and about 300 women and children, who happened to be on board at the time—1100 in all. Of these, however, 200 were saved; but a small vessel, which happened to be anchored near, was drawn into the vortex occasioned by the *Royal George's* descent, and swallowed up; and other vessels were also placed in imminent danger. Captain Waghorn, who escaped, was subsequently tried by court-martial for negligence and carelessness in the careening operation, but was acquitted. This calamitous event has been celebrated in an elegy by Cowper. Many of the guns were fished up soon afterward, and several schemes were projected for the raising of the ship bodily, but without success, until, in 1839, the mass was blown to pieces by the explosion of large metal cases filled with gunpowder. Most of the valuables which had been in the ship were brought up, and the brass guns which were recovered sufficed to defray the cost of the operation.

ROYALL, ISAAC, d. 1781, b. Mass.; represented the town of Medford in the general court, and was for many years a member of the executive council. He served in the French war, was appointed brig.gen. in 1761, and went to England in 1775, being a partisan of the crown. His estate was confiscated in consequence, and he was proscribed. Nevertheless, at his death, he left 2,000 acres of land in Worcester co. to endow at Harvard college a law professorship, which bears his name, as does the town of Royalston, of which he was a proprietor.

ROYAL MARRIAGE ACT. Act 12 Geo. III. c. 2 enacts that no descendant of the body of Geo. II., other than the issue of princesses married into foreign families, shall be capable of contracting marriage without the previous consent of the sovereign, signified under the great seal; and any marriage contracted without such consent is declared void. But such descendants, if above the age of 25, may, after 12 months' notice given to the privy council, contract and solemnize marriage without consent of the crown, unless both houses of parliament shall, before the expiration of the year, expressly declare their disapproval of such intended marriage. The penalties of *præmunire* (q.v.) are attached to all persons who shall solemnize, assist, or be present at any such marriage. This act was passed in consequence of the marriage of the duke of Gloucester, brother of George III., with the countess dowager of Wallegrave, and of the duke of Cumberland with the widow of col. Horton and daughter of lord Ingham. The marriage of the late duke of Sussex in 1793 to lady Augusta Murray, daughter of the earl of Dunmore, was declared by the prerogative court to be a violation of the royal marriage act, and therefore null and void, in Aug., 1794; and the claims of their son, sir Augustus d'Esté, were declared invalid by the house of lords in 1844. The royal marriage act is heartily disapproved by many as impolitic and despotic, and as tending to immorality and scandalous conduct, and was not passed without great resistance in parliament. But the influence of the government was then too strong for public opinion.

ROYAL-MAST, the fourth mast from the deck, and usually the highest carried. It is most commonly made in one piece with the top-gallant-mast. It carries the royal-yard, which bears a sail called the "royal." The royal-mast is surmounted by the truck, at which the pendant or other flag is displayed when necessary.

ROYAL SOCIETY (OF LONDON). The origin of this society may be traced back to those stirring years of civil strife that brought in the commonwealth. Clubs for political, theological, and sectarian purposes were then numerous and active; and in the year 1645, "divers worthy persons, inquisitive into natural philosophy, and other parts of human learning, did, by agreements, meet weekly in London on a certain day, to treat and discourse of such affairs." Among these worthy persons were certain medical men, Dr. Wilkins, afterward bishop of Chester; Foster, professor of astronomy in Gresham college; Wallis, the mathematician; and others, including a learned German from the palatinate; and out of their meetings arose the now world-famous Royal society. Wallis records that the subjects discoursed of were "the circulation of the blood; the valves in the veins; the venæ lacteæ; the lymphatic vessels; the Copernican hypothesis; the nature of comets and new stars; the satellites of Jupiter; the oval shape of Saturn; the spots in the sun, and its turning on its own axis; the inequalities and selenography of the moon; the several phases of Venus and Mercury; the improvement of telescopes, and grinding of glasses for that purpose; the weight of air; the possibility or impossibility of vacuities, and nature's abhorrence thereof; the Torricellian experiment in quicksilver; the descent of heavy bodies, and the degrees of acceleration therein; and divers other things of like nature."

In 1662 the persevering philosophers were, through the "grace and favor" of Charles II., incorporated by charter, in which they were described as the Royal society of London for the promotion of natural knowledge. The king gave them also a race, and subsequently granted two other charters conferring additional powers and privileges. They are inscribed in a handsome volume known as the charter book, which, containing, as it does, the sign-manual of the founder, of other royal personages, and of nearly every fellow elected into the society, presents a collection of autographs unequalled in the world.

Through many difficulties, the young society pursued their way. Their meetings were interrupted by the great fire and the plague; but in March, 1664-65, they published the first number of the *Philosophical Transactions*, and thus commenced a record of their labors and researches, and at the same time a history of science of the highest value, comprising upward of 160 quarto volumes. Besides this, the society publish an octavo serial entitled *Proceedings*, in which an account of the ordinary meetings is set forth. This serial was commenced in 1800, and now fills about 30 volumes. Another publication, in 8 large quarto volumes, is the *Catalogue of Scientific Papers*, containing the titles of scientific papers published in all parts of the world from 1800 to 1873. This great work, invaluable for purposes of reference, was compiled at the cost of the society, and gives in methodical form a record of the scientific progress of 73 years of the century. These works are not restricted to the fellows, but are sold to the general public.

By increase of numbers—including scientific men on the continent, who were elected as foreign members—the society widened their sphere of usefulness. They promoted the publication of Newton's *Principia* and optical works; they lent instruments to Greenwich observatory in its early days, and were appointed visitors of that establishment by queen Anne—a function which they still exercise; they aided travelers and scientific investigators; through force of circumstances they became the advisers of the government on scientific subjects; Cook's celebrated voyage to observe the transit of Venus was undertaken at their instance; and from the voyage of the *Endeavour* down to the voyage of the *Challenger*, it would be difficult to specify a scientific expedition which had not been equipped under the advice of the Royal society.

In 1710 the society removed to a house which they bought in Crane court, Fleet street. In 1780, by order of George III., quarters were assigned to them in the then new palatial building, Somerset house. There they abode until 1857, when, at the request of the government, they migrated westward to Burlington house, a wing of which they now occupy.

The society's session commences on the third Thursday in November, and ends on the third Thursday in June. During this period meetings are held weekly at 8.30 p.m. for the reading and discussion of papers, and these papers are for the most part afterward published in the *Proceedings* or the *Philosophical Transactions*. The anniversary meeting is held on Nov. 30. At that meeting the society elect a council to carry on their work through the ensuing year. This council, comprising president, treasurer, and secretaries, numbers 21 persons.

The number of candidates for election into the society averages between 50 and 60 every year. From these the council select 15, whose names are printed and sent to every fellow, and in June the annual meeting takes place at which the 15 are elected; but any fellow is at liberty to alter the list of names. There are in all about 560 fellows, including 50 foreign members.

The society's income is derived from funded and landed property, and the annual

contributions of the fellows. Each fellow contributes £4 yearly, or pays a life-composition of £60, with an admission fee of £10. These payments entitle him to the *Philosophical Transactions* and *Proceedings*, and to the use of the library of 30,000 volumes. The fund raised for the abolition of admission fees and the reduction of the annual contributions to £3 amounted in 1879 to £10,000.

The society undertakes the administration of the £1000 annually voted by parliament for scientific purposes; also assists in the administration of an additional £4,000 voted (1876-80) for the same purpose. The society also assists in the naming of the meteorological council, which (1879-80) received a government grant of £14,500.

In fulfillment of trusts, the society award annually, in recognition of scientific work and discoveries, the Copley medal and two royal medals; and the Rumford medal every two years for researches in light or heat. To these has been added the Davy medal for chemical investigations.

The most illustrious names in the annals of science appear on the roll of presidents of the royal society.

ROYAL SOCIETY (OF EDINBURGH) was incorporated by royal charter in 1783. It owed its origin to principal Robertson, the historian, who successfully labored to found in Edinburgh a society on the model of the Berlin academy, for the investigation and discussion of subjects in every branch of science, erudition, and taste. The society was formally constituted at a meeting held in the college library on June 23, 1783, where the subsequent meetings were held till 1810, when the society purchased a house in George street. In 1825 the society removed to its present apartments, leased from government, in the royal institution building in Princes street. The original list of members included the names of most of the literati of Scotland. The first president was Henry, duke of Buccleuch. He was succeeded in 1812 by sir James Hall, who, resigning in 1820, was succeeded by sir Walter Scott. On the death of sir Walter in 1832, sir Thomas M'Dougall Brisbane was appointed president; and was succeeded in 1860 by the duke of Argyll. In 1864 sir David Brewster, K.H., became successor to the duke, on whose death, in 1868, sir R. Christison was elected. In 1873 sir William Thomson was elected, and held that honorable office for a period of five years.

The meetings of the society are held on the 1st and 3d Mondays of every month from November to June. The admission fee of resident fellows is £2 2s., and the annual contribution is 23 3s., which, after 10 years, is reduced to £2 2s., and ceases after 25 years' membership. The society is also assisted by an annual grant of £300 voted by parliament. The papers read before this learned body are published in its *Transactions*, of which 26 volumes have been published in quarto. Abstracts of the papers also appear in its *Proceedings*, of which 7 volumes have appeared in octavo.

The number of *ordinary* fellows is upward of 370; and of *honorary* fellows, near 60.

The society has the disposal of some valuable prizes, which are bestowed on the authors of the best communications on scientific and other subjects. These are the Keith prize, founded by Alexander Keith of Dunnottar; the M'Dougall Brisbane prize, founded by sir Thomas M. Brisbane; and the Neill prize, founded by Patrick Neill, esq., LL.D.

ROYER-COLLARD, PIERRE-PAUL, a French statesman, b. June 21, 1763, at Sompuis (Marne). The childhood of Royer-Collard was spent at his father's house, under the severe surveillance of his mother, who belonged to a family ardently devoted to Jansenism. He was sent to college at Chaumont, and afterward at Saint-Omer, which was superintended by one of his uncles, the abbé Collard. Having passed as advocate at an early age, he pleaded several times before the old parliament; but from the first days of the revolution he was involved in the events of that time, having been elected one of the representatives of the commune of Paris. From 1790 to 1792 he acted as joint-secretary of the municipality. It was then that he was connected with Pétion and Danton. The events of May 31 obliged him to remove from Paris. He then returned to Sompuis, and lived in obscurity during the whole time of the reign of terror, studying and following the plot himself, to evade the suspicions of the Jacobins. Three years afterward, in 1797, the electors of this department chose him to represent them in the council of the five hundred. Royer-Collard took an active part in the work of that assembly. He was one of those honest men who, preferring monarchy, but fearing a violent counter-revolution, consented to try the republic with a moderate government, cherishing the hope, in the mean time, of an ultimate restoration. The 18th Fructidor completely opened his eyes and dispelled his illusions. It was then that he turned his thoughts to what he believed to be the only hope of France, and that he began a correspondence with Louis XVIII., which, however, ceased toward the epoch of the establishment of the empire. For some years afterward he ceased to have anything to do with politics, and entered on another career. He was offered the chair of philosophy (1809) by Napoleon in the recently created university of France, which he accepted after great hesitation. Applying himself vigorously to study for it, he was soon highly qualified to fulfill his duties. In the few years he occupied this chair, he exercised an immense influence on the philosophy of France. Rejecting the purely sensuous system of Condillac, he proceeded eclectically, giving special prominence to the principles

of the Scottish school of Reid and Stewart. He originated the "Doctrinaire" school, of which Jouffroy and Cousin were the chief representatives.

The restoration deprived the cause of education of the services of Royer-Collard. The Bourbons did not overlook the man who had not ceased, since 1798, to maintain their cause; but Royer-Collard, who had all along dreamed of the union of hereditary monarchy with an enlightened liberty, was ill-fitted to act with the royalist fanatics now dominant in France.

Royer-Collard was appointed president of the commission of public instruction (Aug. 15, 1815), which office he held, with the title of counselor of state, till July, 1820. He gave in his resignation at that time, not wishing to associate himself with the politics of the ministry. In 1815 the electors of Marne chose him to represent them in the famous "Chambre Introuvable" (q.v.). He took part in all the business of the chamber, remaining steadfastly attached to the king, but energetically opposing the *ultra* party. In the next parliament he rejected with great energy the idea of confiding public instruction to the clergy. "The university," he exclaimed, "has the monopoly of education, nearly as much as the courts have that of justice, and the army that of the public force."

At the end of the session 1817 Royer-Collard for the first time withdrew from the government, at least from the course pursued by the ministry. He once more supported it in a new discussion against the predominance of the Catholic church; but dating from 1819 the rupture was complete. He presented then the singular spectacle of a devoted royalist seconding the efforts of the liberals. The French academy opened its doors to him in 1827; and in 1828 he was named president of the chamber of representatives. As president Royer-Collard had to present the famous address of the 221 deputies (March, 1830), refusing their support to the government, which the king refused to hear read. Next day the chamber was prorogued. Royer-Collard departed for Châteaueux, his country-seat, where he went to conceal fears and regrets which the revolution of July was to justify. He was re-elected in June, 1830, and he accepted this mandate. In 1842 he withdrew from parliamentary life, and after that lived in great retirement.

Although Royer Collard had a considerable fortune, he never departed from the greatest simplicity, excepting for three things—the purchase of books, charity, and the receptions which his official position imposed on him. He received with politeness, but with a certain coldness which he could never lay aside. His salon was very much frequented by the political world. Every Sunday the principal leaders of the moderate opposition assembled there: it was a large room, serving as a study, the walls of which were hidden from top to bottom by shelves loaded with books; not a single ornament—no fine furniture—what was strictly necessary, and no more. There assembled Cousin, the most eminent of his pupils; Guizot, the duke de Broglie, Casimir Périer, De Barante, Villemain, Ampère, Andral, De Rémusat, De Barthélemy, Gabriel, and many others. There was little conversation, properly so called; the slow and sonorous voice of Royer-Collard was dominant in the room. The subjects were almost always the political events and the debates in parliament; the acts of the government were not spared. This salon was the echo of the liberal world.

From 1842 Royer-Collard had completely withdrawn from public life, his health, in fact, not allowing him to occupy himself with public matters. He spent only the winter in Paris, returning in summer to his estate of Châteaueux, where he died Sept. 4, 1845.

Royer-Collard is undoubtedly one of the most noted men of the 19th century. He exercised on his contemporaries a powerful influence, owing more, perhaps, to the uprightness, firmness, and extreme earnestness of his character, than to intellectual power or genius. Excepting his political speeches, published in the *Moniteur*, Royer-Collard left few published works. A lecture on external perception appeared in 1813; some of his minor articles are given in Jouffroy's translation of Reid. See the biographies by Philippe (1857), and Barante (new ed. 1878).

RSHEW, or **RJEV**, a t. of European Russia, in the government of Tver, and 80 m. s.w. from Tver, on the Volga, which passes through it. It is a place of much commerce, has salt and corn magazines, and two great annual fairs. Pop. '67, 17,528.

RUATAN, or **RATTAN**, an island situated in the bay of Honduras, in the Caribbean sea, in lat. 16° 30' n., long. 86° 30' w. It is 20 m. long by 9 broad in its widest part, and its dependencies are Bonacca, Uilla, Helena, Barbarette, and Morat. The whole comprise the colony of the bay islands, and were formerly part of the British dominions, but they were surrendered in 1860 to the republican government of Honduras. The island has a fine climate with a prolific soil. The population, estimated at about 2,000 souls, of whom about 200 are whites, including nearly 100 Spaniards, are principally emigrants from the Caymans.

RUBASSE, a mineral, much prized for ornamental uses, is rock crystal, limpid or slightly amethystine, filled internally with minute brown spangles of specular iron, which reflect a bright red equal to that of the most brilliant ruby. There is an artificial rubasse, made by heating very pure rock crystal red hot, and repeatedly plunging it into a colored liquid.

RUBATO, *TEMPO* (Ital. stolen time), in music, a capricious style of performance in which some notes are prolonged beyond their legitimate time, while others are curtailed, the aggregate value of the bar remaining unaltered. It is a style of performance which is very apt to be abused by inferior players and singers.

RUBBLE, a common kind of masonry, in which the stones are irregular in size and shape. Walls faced with ashlar are generally packed with rubble at the back. Rubble is of various kinds, according to the amount of dressing given to the stones. Common rubble is built with stones left almost as they come from the quarry. Hammer-dressed rubble is so called when the stones are squared with the mason's hammer; coursed rubble, when the stones are squared and equal in height, etc.

RUBEFACIENTS are external agents employed in medicine for the purpose of stimulating and consequently reddening the part to which they are applied. All agents which, after a certain period, act as blisters, may be made to act as rubefacients, if their time of action is shortened. The mildest rubefacients are hot poultices, cloths soaked in very hot water, moderately stimulating liniments—as, for example, soap-liniment, with various proportions of liniment of ammonia, or chloroform, etc. Spanish fly, in the form of *emplastrum catijficiens*, or warm plaster, in which the active ingredient is blunted by the free admixture of soap-plaster, resin-plaster, etc., is a good form of this class of agents. Capsicum or Cayenne pepper, in the form of a poultice, is an excellent rubefacient; it is much used in the West Indies, but is seldom employed in this country. Mustard, in the form of *cataplasma sinapis*, or mustard poultice, and oil of turpentine, are perhaps the best of the ordinary rubefacients. The former is applied to the soles of the feet and the calves of the legs in the low stage of typhus fever, in apoplexy and coma, in narcotic poisoning, etc. It is also applied to the chest, with much advantage, in many cases of pulmonary and cardiac disease, and to the surface of the abdomen in various affections of the abdominal viscera. The best method of employing turpentine is to sprinkle it freely on three or four folds of clean flannel, wrung out of boiling water. The sprinkled surface of this pad is placed upon the skin, and a warm dry towel is laid over the flannel. Two or three such applications will produce a powerful rubefacient effect. Turpentine thus applied is serviceable in all the cases mentioned in the remarks on mustard, as well as in sore throat, chronic rheumatism, neuralgia, etc.

RUBENS, PETER PAUL, one of the greatest of Flemish painters, was b. probably at Siegen, in Westphalia, June 29, 1577. His parents settled in Cologne in 1578, where they remained till 1587, when Rubens's father died, and his mother removed with her family to Antwerp. He was first placed under Verlaagt, a landscape painter; however, inclining more to historical painting, he became a pupil of Van Noort, but soon quitted his school for that of Otto Van Veen, or Venius, who then enjoyed a high reputation; and after studying four years with that painter went to Italy in 1600. Recommended to Vincenzo Gonzago, duke of Mantua, he was sent on a mission by the duke to Philip III. of Spain, and on that occasion painted several portraits of Spanish noblemen. He also spent a considerable time at Venice and Rome making copies for the duke, and executing independent works, which added largely to his reputation. In 1608, after an absence of eight years, Rubens returned to Antwerp on account of the illness of his mother, but she died before he had accomplished the journey. He intended to return to Mantua, but was induced to remain by the archduke Albert, governor of the Netherlands. In 1621 he visited Paris by invitation of Maria de' Medici; and in 1625 completed the series of sketches for the pictures destined to adorn the palace of the Luxembourg. Rubens was sent by the Infanta Isabella, widow of the archduke Albert, on a diplomatic mission to Philip IV. of Spain, in 1628; and in the following year, on a similar mission to Charles I. of England, by whom he was knighted in 1630. Rubens's success as a political diplomatist is worth noting, and seems to indicate a large, solid, and practical nature, such as painters in general do not possess. He died, very rich, in 1640. Rubens is the acknowledged head of the Flemish school. By the expression of powerful and energetic action, and strongly marked character—by great breadth and brilliant coloring he successfully embodied the tendencies of the age in which he lived to pleasures of sense, strong passion, and stirring action; and while admitting the coarseness, and almost grossness of his subjects, especially where the nude figure is introduced, we are in a manner carried away by the spirit of joyousness and an animal vigor conspicuous in his works, and the truthful manner in which he viewed nature. His portraits rank with the highest efforts in that walk of art. He painted animals admirably; and his landscapes possess great brilliancy and natural effect. He was perhaps the greatest master in the mechanical part of the art. His style has had great influence on the English school. The tercentenary of Rubens's birth was celebrated at Antwerp in 1877 with great enthusiasm and with elaborate and splendid festivities.

RUBEOLA. See MEASLES.

RUBIACEÆ, a natural order of exogenous plants, in which, according to many botanists, the *cinchonaceæ* are included as a suborder; but which, as restricted by others (*stellata* of Ray, *galiaceæ* of Lindley), consists entirely of herbaceous plants, with

whorled leaves, angular stems, and numerous very small flowers; the calyx superior, with 4, 5, and 6 lobes, or almost wanting; the corolla wheel-shaped, or tubular, regular, inserted into the calyx, and with the same number of divisions as the calyx; the stamens equal in number with the lobes of the corolla; two styles; the fruit a dry pericarp with two cells, and one seed in each cell. There are between 300 and 400 known species, chiefly abounding in the northern parts of the northern hemisphere, and on the mountains of tropical regions. The most important plant of the order is madder (q. v.). To this order belong also bedstraw (q. v.) and woodruff (q. v.).

RUBICON, a stream of central Italy, falling into the Adriatic, has obtained a proverbial celebrity from the well-known story of its passage by Cæsar, who, by crossing this river—which, at the outbreak of the civil war between him and Pompey, formed the southern boundary of his province—virtually declared war against the republic. Hence the phrase, “to cross the Rubicon,” has come to mean, to take an irrevocable step. The modern Luso, called by the peasants on its banks *Il Rubicone*, has claims to being the ancient Rubicon; but arguments preponderate in favor of the *Fiumicino*.

RUBIDIUM (sym. Rb. eq. 85.4) and **CÆSIUM** (sym. Cs. eq. 133) are two alkaline metals, discovered in 1860–61, by Bunsen and Kirchhoff, by means of spectrum analysis. They resemble potassium more nearly than any other substance, and their names are derived from *rubidus*, dark red, and *cæsius*, sky-colored, in consequence of two red lines of remarkably low refrangibility being present in the spectrum of the former, and two characteristic blue lines in that of the latter. They are widely diffused in nature, but always occur in very small quantities. They have been detected in many mineral waters, and in certain minerals; as, for example, lithia-nica, lepidolite, petolite, and feldspar; and they have been found in the alkaline ashes of the beet-root. The best material for the preparation of rubidium is lepidolite, which will sometimes yield as much as 0.2 per cent of the metal, while the principal source of cesium is the brine of Dürkheim, in which both these metals were originally found; every ton of the water containing about three grains of chloride of cesium, and rather less than four grains of chloride of rubidium. It has, however, been recently asserted that the mineral *pollux* contains no less than 34.07 per cent of oxide of cesium. Both metals are so analogous to potassium, that they cannot be distinguished either from it or from one another by reagents, or before the blow-pipe. Like potassium, they form double salts with bichloride of platinum, which are much more insoluble than the corresponding potassium salt; and it is on this property that the separation of these metals from potassium is based. It is unnecessary to enter into any details regarding the compounds of these metals. It is worthy of remark that rubidium is electro-positive toward potassium, and that cesium is electro-positive toward rubidium and potassium, and is thus the most electro-positive of the known elements.

The notice of cesium is included in this article, because its recent discovery prevented it from being considered in its proper alphabetical place in the original edition of this work. For the same reason, we may here briefly notice another metal, **INDIUM**, discovered by Reich and Richter in the Freiburg arsenical ores. Its most striking property, and that which led to its discovery, is the indigo-blue line which all its compounds (in so far as they have been investigated) show in the spectroscope. Its eq. is 37—new system, 113; its sp. gr. varies from 7.1 to 7.2; its color is between those of tin and silver; it is exceedingly soft and very ductile; and its fusing-point is about that of lead.

RUBINI, GIOVANNI BATTISTA, 1795–1854; b. Italy; made a successful *début* as a singer at Brescia in 1815. He appeared at Paris in 1825, and was soon recognized as the first tenor singer living. His voice ranged from E to F above the staff, and sometimes reached G above the staff. He sang in all the principal European cities, retiring from the stage in 1846. His acting was much inferior to his singing.

RUBINSTEIN, ANTON, b. Russia, 1829; taken to Moscow at an early age, and studied the piano under Alexis Viljoing. He made his first appearance in public when only eight years old, and at the age of ten went with his teacher to Paris, where his performances won for him the encouragement and the advice of Liszt. He then visited England, Sweden, and Germany, and studied composition under Dehn at Berlin. After devoting himself for some time to teaching at Berlin and Vienna he returned to Russia, where he was appointed pianist to the grand-duchess Helena, and subsequently director of the concerts of the Russian musical society. In 1868 he again started on a concert tour, achieving both in Paris and London a brilliant success; and in 1873 came to the United States, where he was enthusiastically received. Among his compositions are the operas *Dimitri Donskoi*; *Les Chasseurs Sibériens*; *La Vengeance*; *Tom le Fou*; *Les Enfants des Bruyères*; *Lalla Roukh*; and *Nero*; an oratorio, *Paradise Lost*; and a sacred drama, *The Maccabees*.

RUBLE, **ROUBLE**, or **RUBEL**, the unit of the Russian money system. Pieces of peltry formed, in early times, the ordinary medium of exchange in Russia; but about the beginning of the 15th c., silver bars came more and more into use for larger payments, and to make up intermediate sums pieces of the bars were cut off. It was in this cutting off—in Russian, *rubat*—that the name ruble originated. The present silver ruble

is equivalent to 3s. 2½d. sterling, nearly. Half, quarter, fifth, tenth, and twentieth parts of a ruble are also coined in silver; and gold coins of nominally five rubles (demi-imperials) and three rubles (imperial ducats) are also in circulation. In 1877 the paper ruble had fallen from 6.20, its nominal value, to 10.55 of a pound sterling. The ruble is divided into 100 kopeks.

RUBRICS (Lat. *rubrica*, from *ruber*, red), in classic use, meant the titles or headings of chapters in certain law-books, and is derived from the red color of the ink in which these titles were written, in order to distinguish them from the text. In mediæval and modern use the name is restricted to the directions which are found in the service-books of the church, as to the ordering of the several prayers, and the performance of the sometimes complicated ceremonial by which they were accompanied. The same name, together with the usage itself, is retained in the church of England prayer-book; and in all these, even where the direction has ceased to be printed in red ink, the name rubric is still retained. Where red ink is not employed the rubric is distinguished from the text by italics, or some other variety of print. In the Catholic church a considerable controversy exists as to whether the rubrics of the missal, the ritual, and the breviary are to be considered preceptive or only directive—a question into which it would be out of place to enter. A similar controversy has existed at various times in the English church. The science of rubrics is with Catholics a special branch of study, the chief authorities on which are Gavanti, Merati, Cavalieri, and other more compendious writers.

RUBRUQUIS, WILLIAM DE, one of the most distinguished of mediæval travelers, was born early in the 13th c.—probably about 1228. He entered, while very young, into the Franciscan order, and being hindered in his favorite scheme of missionary labor in the Holy Land, he was sent by Louis IX. of France into Central Asia for the purpose of forming an alliance with Sartach, the son of Batû Khan of Kiptchak, a supposed Christian sovereign, against the infidels who held the Holy Land. Taking Constantinople as the starting-point, Rubruquis, with two companions, also Franciscans, sailed for Soudaia—now Soujac—near Cherson, made his way across the steppes between the Dnieper and the Don, and crossing the latter river, reached, Aug. 2, 1253, the camp of Sartach, who was now discovered not to be a Christian, and by whom they were sent forward to his father, Batû. When they reached the encampment of Batû on the Volga, near its mouth, that prince refused to treat with them, and sent them forward to the Tartar emperor, Mangû Khan, whom they reached on Dec. 27. At this rude court they remained for several months, and accompanied it about Easter to Kara-korum, where they found a few Europeans. Some time afterward, Rubruquis, being charged with having spoken of the emperor as an infidel, although he defended himself courageously, was compelled to return, but was treated with a certain degree of rude consideration. Proceeding along the banks of the Volga, he penetrated the difficult defiles of the Caucasus, proceeded through Armenia, Persia, and Asia Minor, to Syria, arriving at Tripoli in Aug., 1255, having spent two years and a half in his eastern travel. As king Louis, by whom the mission had been accredited, had meanwhile returned to France, Rubruquis requested permission to follow him, in order to report the result; but fortunately for science the Franciscan provincial refused to permit him to leave the east, and directed him to report in writing. To this fortunate severity we owe the interesting and curious account which he drew up, and of which a lucid summary will be found in Lardner's *Cyclopædia, Inland and Maritime Discovery*, vol. i. p. 261, and following. Of the later history of Rubruquis, the only fact known is that he was still living in 1293, when Marco Polo was returning from the east. His narrative is among the most plain and sober in its tone of all that have come down to us from the adventurous voyagers of the 13th century.

RUBUS, a genus of plants of the natural order *rosaceæ*, suborder *potentilleæ*, distinguished by a 5-lobed calyx without bracts, and the fruit formed by an aggregation of small drupes adhering to each other upon a long *torus*. The fruit is edible in all, or almost all, the species, which are very numerous, and natives chiefly of the colder parts of the northern hemisphere, although some are natives of warm climates, and are occasionally to be seen in our hothouses. Some of them are herbs with perennial roots, some are shrubs with subligneous—often only biennial—stems, and they have digitate, pinnate, or lobed leaves. They cause great difficulty to botanists, the varieties being extremely numerous, and the specific distinctions very uncertain. The raspberry (q.v.) and bramble (q.v.) are well-known fruits. The cloudberry (q.v.) also belongs to this genus. Besides these and the species most nearly resembling them and which have been described along with them, notice may be taken of *R. spectabilis*, a shrubby species, with leaves of three leaflets and fine large dark purple fragrant flowers, produced singly on long terminal flower-stalks, a native of the banks of the Columbia river. The fruit is about the size of a raspberry, dark yellow, acid, and somewhat astringent, making excellent tarts.—*R. saxatilis*, sometimes called the *stone bramble*, is a perennial herbaceous plant, with slender stem, leaves of three leaflets, small greenish-yellow flowers, and pleasant fruit of very few rather large drupes. It is a native of stony places, in mountainous parts of Britain.—*R. arvensis* is a small herbaceous plant with creeping roots, slender stems 2 to 6 in. high, each with three or four leaves, which have three leaflets; the flowers large and of deep rose color,

and a purplish red fruit of exquisite flavor. This interesting plant is a very doubtful native of the highlands of Scotland, but is very abundant in Norway and Sweden, Siberia, and other arctic countries. In Siberia it is known by a name signifying *princeberry*. A syrup, a jelly, and a wine are made of it. The fruit is highly esteemed; but although the plant grows very well in our gardens, it seldom bears fruit.

RUBY, a gem much prized, and only inferior in value to the diamond, or perhaps also to the sapphire. It is regarded by mineralogists not as a distinct species, but as a mere red-colored variety of sapphire (q.v.) or of spinel. The *balas ruby* is rose-red. The almandine ruby is tinged with violet or brown. The finest red rubies are generally known as *oriental rubies*, and are indeed brought from the east, chiefly from Ceylon and the Burman empire. The best generally come from the neighborhood of Syriam, in Pegu. In Ceylon rubies are found in remarkable abundance in alluvial deposits, which have been searched for them for ages, whilst the natives seem never to have thought of digging in the rock of the mountains; but Dr. Gygax found innumerable small rubies in a state of decomposition, falling to powder in a stratum of gray granite with iron pyrites and molybdena; and sir James E. Tennent thinks that mines might be opened with confidence of success. Sir Alexander Burnes describes a ruby mine at Badakshan, in Bactria. Tavernier states that the throne of the great mogul was adorned with 108 rubies, of from 100 to 200 carats each. The king of Arracan is said to have possessed a ruby, in the form of a six-sided prism, about an inch in diameter, terminated by a six-sided pyramid. But the greatest ruby ever heard of was that possessed by the king of Ceylon, which, according to Marco Polo, was a span in length, as thick as a man's arm, and without a flaw. Kublai Khan sent an ambassador to demand this ruby, offering the value of a city as its price; but the Ceylonese refused to sell it. What has become of it is not known.

RÜCKERT, FRIEDRICH, a German lyric poet, was b. May 16, 1789, at Schweinfurt, and died in Jan., 1866. He received his education at the gymnasium of his native town, and studied at Jena university. In 1826 he was nominated professor of oriental languages at Erlangen; went in 1840 to Berlin, as professor and privy-councillor, but resigned that position in 1849, and lived on his estate of Neuses in Coburg. Rückert began his literary career under the pseudonym of Freimund Raimar with his *Deutsche Gedichte* (German Poems, Heidelb. 1814); and *Napoleon, eine Politische Komödie in drei Stücken* (Napoleon, a Political Comedy in three Parts, Stuttg. 1816). Under his own name he published: *Kranz der Zeit* (A Wreath of the Time, Stuttg. 1817); *Oestliche Rosen* (Eastern Roses, Leip. 1822); *Gesammelte Gedichte* (Collected Poems, 6 vols. Erl. 1834-38). As fruits of his oriental studies are to be considered his translations of Hariri's *Mokamen*, under the title *Die Verwandlungen des Abu-Seid* (The Transformations of Abu-Seid, 2 vols. Stuttg. 1826); of the Indian tale, *Nal und Demajanti* (Frank. 1828); *Hamasa, oder die Älteste Arabische Volkslieder* (Hamasa, or the oldest Arabic Ballads, 2 vols. Stuttg. 1846), and *Amrillkais der Dichter und König* (Amrillkais, the Poet and the King, Stuttg. 1847). Original poems of Rückert, also relating to the east, are *Morgenländ. Sagen und Geschichten* (Eastern Tales and Stories, 2 vols. Stuttg. 1837); *Erbauliches und Beschauliches aus dem Morgenländ* (2 vols. Berl. 1837); *Rostem und Suhrab* (Erl. 1838); *Brahmansche Erzählungen* (Brahmanic Tales, Leip. 1839); *Die Weisheit des Brahmanen, ein Lehrgedicht in Bruchstücken* (The Wisdom of the Brahman, a Didactic Poem in Fragments, 6 vols. Leip. 1836-39); *Leben Jesu* (The Life of Jesus, Stuttg. and Tüb. 1839). The titles of his dramas are: *Saul und David* (Erl. 1843); *Herodes der Grosse* (2 vols. Stuttg. 1844); *Kaiser Heinrich IV.* (2 vols. Frank. 1845); *Cristoforo Colombo* (2 vols. Frank. 1845). Rückert was one of the most learned, versatile, and sprightly lyrists of modern times. He tried all sorts of meters, the Greek hendecasyllabic, the old Norse alliterative verse, the old German couplet, the *Nibelungen* strophe, the popular ballad, the delicate yet stately measure of the eastern gazelle (sonnets), and every kind of European quatrains, distiches, etc.; and he succeeded in all. Perhaps his fancy and wit were more remarkable than his depth of lyric feeling, yet the simple pathos of such pieces as the *Aus der Jugendzeit* could hardly be surpassed.

RUDD. See RED-EYE.

RUDDER, in a ship or boat, is that part of the steering apparatus which is in immediate contact with the water. It is hung to the stern-post by pintle and brace hinges, and the upper end, passing into the vessel, is acted on by the tiller. So long as the rudder is in a straight line with the keel, the water which glides past the vessel acts equally on both sides, producing equilibrium; but if the rudder be turned, to the right for example; it will be relieved from the pressure on the left side, while that on the right side will act with greater force, and cause the ship to revolve round the center of gravity. When the head has turned sufficiently, the rudder is again put in line with the keel. See HELM.

RUDDER-FISHL, *Pallinurus pereiiformis*, a scaberoïd fish having the first dorsal fin composed of isolated spines connected by a narrow membrane; gill-covers serrated and spiny; body elevated, compressed, and oblong; tail without lateral keel; teeth small, pointed, and nearly equal; length from 9 to 12 inches; color bluish, white on the sides, with minute black spots; top of head and back marked with black blotches.

RUDDIMAN, THOMAS, the greatest of Scottish grammarians, was b. in Banffshire, at a place called Raggel, in the parish of Boyndie, Oct., 1674. He received the rudi-

ments of his classical education at the parish school, where he already gave promise of his future proficiency. At 16 years of age he went to King's college, Aberdeen, where he took his degree of M.A. four years later. On leaving the university he was engaged as tutor in a private family, in which capacity he remained a year; and thereafter became parish schoolmaster at Laurencekirk. Here he accidentally made the acquaintance of the celebrated physician and Latinist, Dr. Archibald Pitcairne, who was so impressed with Ruddiman's learning and sagacity that he exerted his influence, and succeeded in getting him appointed assistant book-keeper of the Advocates' library, Edinburgh. His new office gave him ample opportunity for prosecuting his favorite studies, but the remuneration was so small that, in 1707, he was compelled to commence business as an auctioneer. It was at this time that he began his career as an editor by publishing an edition of Volusenus's (Florence Wilson's) *Dialogue on the Tranquillity of the Mind*, to which he prefixed a life of the author. In 1709, he published Arthur Johnston's *Poetical Paraphrase of the Song of Solomon*, and the same author's *Cantica*—both in Latin. In 1714 appeared his well-known work—by which his name will always be honorably perpetuated among Scotchmen—*Rudiments of the Latin Tongue*, a text-book from which, under a great variety of forms, his countrymen still continue to be initiated into classical literature. In 1715 he published his great edition of Buchanan's works (2 vols. folio); and in that year, exchanged the calling of an auctioneer for the more congenial one of printer. In this capacity he was assisted by his brother, who became his partner, and had been originally bred to the business. Some years afterward, he was appointed printer to the university of Edinburgh. In 1725 he published the first part of his great grammatical work, his *Grammaticæ Latinæ Institutiones*, which is devoted to the etymology of the language; and in 1732, the second part, which treats of the syntax. His philological reputation rests mainly on this work, which has been re-edited in Germany by Stallbaum, and is repeatedly referred to in the Latin lexicon of Freund. He also prepared an elaborate treatise on prosody, of which, however, he published only an abridgment. His next appointment was that of principal keeper of the Advocates' library. In this capacity he published a magnificent edition of Anderson's *Diplomata et Numismata Scotiæ* (1 vol. folio), and prefixed a learned introduction in Latin. Controversy with men such as Benson, who contrasted the Latin verse of Johnston unfavorably with that of Buchanan, and with Logan on the hereditary right of the kings of Scotland to the crown, consumed a great part of his time, but did not so preoccupy his thoughts as to prevent him from publishing, in 1751, an edition of Livy in 4 vols. 12mo, a gem of typography, and still known as the "immaculate" edition, from its entire exemption from errors of the press. Ruddiman died in Edinburgh, Jan. 19, 1757, in his 83d year. In politics he was, like his friend Pitcairne, an ardent tory and Jacobite; and in private life, a most upright and estimable man. Besides the publications already noted, he edited the translation of Virgil's *Æneid* by bishop Gawain Douglas, and appended a very valuable glossary (folio, 1710). He also founded the *Caledonian Mercury* newspaper, and published or edited a multitude of minor tracts and books. His life has been written by George Chalmers, the antiquary (1 vol. 8vo. 1794).

RUDENTURE, the molding, in form like a rope or staff, filling the flutings of columns, usually one third of the height. It is sometimes plain and sometimes ornamental.

RÜDESHEIM, a small t. of Prussia, in Hessen-Nassau, on the right bank of the Rhine, opposite Bingen, and 16 m. w. of Mainz. In the vicinity is grown one of the most aromatic and fiery of the Rhine-wines (q.v.) called the *Rüdesheimer*; about 650 casks are produced yearly. Pop. 2,500.

RUDOLF, or **RODOLF**, of Hapsburg, the founder of the imperial dynasty of Austria, which for a time was that of Germany, was b. in 1218, and was the son of Albert, count of Hapsburg and Hedwig of Kyburg-Züringen. Rudolf early exhibited great personal daring and military skill, and acquired celebrity in his native canton of Aargau for the prowess and ability with which he repulsed many bands of banditti who infested the district. The death, in 1264, of his uncle, Hartmann of Kyburg, to whose rich heritage he succeeded, raised him from the condition of a poor noble to the rank of an influential lord of extended territories, which included the greater part of Aargau, and various domains in the cantons of Bern, Lucerne, Zug, and Zürich. The able manner in which he governed these dominions, and exercised the functions of protector of the Waldstätter or forest cantons, attracted the notice of some of the great electoral princes of Germany; and on the death of the emperor Albert in 1273, Rudolf was elected his successor, chiefly through the instrumentality of his powerful friend, the archbishop of Mainz. The ratification by pope Gregory XI. of Rudolf's title was obtained at the cost of various concessions, as, for instance, the renunciation of all jurisdiction in Rome, and of all feudal superiority over Spoleto and the marches of Ancona; together with the cession of all right on the part of the emperor and his successors to interfere in ecclesiastical elections, or in the internal administration and management of the German church. By this agreement the feuds were appeased which had existed for nearly 200 years between the empire and the see of Rome, and Rudolf was able to turn his attention to the settlement of the internal disturbances of

Germany. His chief enemy was Ottocar, king of Bohemia, under whom he had once served against the Prussians and Hungarians, and who now refused to do homage to him. Fortune, however, favored Rudolf in the war with the Bohemian king, who, after a first defeat, again rose in arms against the empire, but was ultimately defeated and killed in battle (1278), when the emperor seized all the Austrian territories which Ottocar had possessed. Wenceslaus, the son of the slain king, having lost no time in tendering homage for the kingdoms of Bohemia and Moravia, the cause of the war was at an end, and peace being restored, Rudolf thenceforth devoted himself to the organization of the state. His great merit was in breaking the arbitrary power of the nobles, by compelling them to demolish the fortresses and strongholds, by means of which they carried on plundering expeditions against one another, and defended themselves from the power of the law; and we are told that in one year he condemned to death 20 refractory nobles, who had long disturbed the public peace, and razed to the ground double that number of strongholds. He also granted charters to many trading towns and municipalities, and thus gave considerable impetus to trade. The policy of his rule generally was indeed so greatly to favor the burgher and working classes, and to repress the tyranny of the powerful nobles, that his reign presented in this respect a favorable contrast to those of his predecessors, and the respect in which he was held by all ranks bears the strongest testimony to his admirable qualities as a ruler. Rudolf died in 1291, and was succeeded in Austria by his son, Albert I., duke of Austria. See Schönhuth's *Geschichte Rudolf's von Habsburg* (2 vols., Leips. 1843-44).

RUDOLF or **RODOLF II.**, eldest son of the emperor Maximilian II. of Germany, was b. in 1552 and educated at the Spanish court by the Jesuits. On the death of his father in 1576 he succeeded to the imperial crown, after having, during the lifetime of his father, been proclaimed king of the Romans. This first reigning namesake of the great progenitor of the Austrian dynasty did not add to the dignity or greatness of the Hapsburg family; and the whole of his reign of 36 years was marked by persecutions and intolerance on his side, and by discontent and even insurrection on that of his subjects. His bigotry and intolerance in forbidding Protestants the free exercise of their religion, led them to ally themselves with their co-religionists in the Low Lands and in France (1608), and by implicating the empire in foreign wars, augmented taxation, and increased the monetary difficulties of the state. Rudolf, who was gloomy, taciturn, and bigoted, had not the qualities necessary to secure the good-will of those around him, and he died, unregretted by his subjects, Jan. 20, 1612, leaving no issue, and bequeathing to his brother Matthias, who succeeded him, an impoverished and distracted state. Rudolf's taste for astrology and the occult sciences, and his anxious desire to discover the philosopher's stone, led him to extend his patronage to Kepler and Tycho Brahé, whose study of astronomy was thought specially to qualify them for that much-coveted discovery; and the patronage which Rudolf extended to the Danish discoverer, when the latter was compelled to leave his own country, through the jealousy of his brother-nobles, has proved one of the few claims possessed by Rudolf to the grateful remembrance of late times. The important astronomical calculations begun by Tycho, and continued by Kepler, which are known as *The Rudolphine Tables*, derive their name from this emperor, who originally undertook, but subsequently failed, for want of means, to defray the expenses incidental to the undertaking. See Kurz's *Geschichte Oestreichs unter Kaiser Rudolf* (Linz. 1821).

RUDOLSTADT, the chief t. of the principality of Schwarzburg-Rudolstadt, is charmingly situated in a hill-girt valley, on the left bank of the Saale, 18 m. s. of Weimar. Pop. '75, 7,638.

RUDRA is, in Vedic mythology, a collective name of the gods of the tempest, or Maruts, Rudra (in the singular) being the name of their father. (See John Muir's *Contributions to a Knowledge of the Vedic Theogony and Mythology*, in the *Journal of the Royal Asiatic Society*, new series, vol. i. part 4, London, 1864). In later and Puranic mythology (see HINDU RELIGION and PURĀNA), Rudra (the terrible) is a name of Śiva, and the Rudras are his offspring. "From Brahmā's forehead," the *Vishṇu-Purāna* relates, "darkened with angry frowns, sprang Rudra, radiant as the noontide sun, fierce, and of vast bulk, and of a figure which was half male, half female. "Separate yourself," Brahmā said to him, and having so spoken, disappeared: obedient to which command, Rudra became twofold, disjoining his male and female natures. This male being he again divided into eleven persons, of whom some were agreeable, some hideous, some fierce, some mild; and he multiplied his female nature manifold, of complexions black or white." See Wilson's *Vishṇu-Purāna*.—The word *rudra* apparently comes from the Sanskrit *rud*, weep; but as the sense of this radical does not yield any satisfactory clue to the meaning of the deity called Rudra, the *Purānas* invented a legend, according to which Rudra received this name from Brahmā, because, when a youth, he *ran about crying aloud*; and when asked by Brahmā why he wept, replied that he wanted a name. "Rudra be thy name," rejoined Brahmā: "be composed; desist from tears." In this legendary etymology there is, moreover, a punning on the similarity between *rud*, cry, and *dru*, run—an illustration of one of the sources whence the later mythology of India derived some of its boundless stock of absurd myths.

RUE, *Ruta*, a genus of plants, of the natural order *rutaceæ*, having a short 4 to 5 parted calyx, 4 or 5 concave petals, affixed by a claw, 8 or 10 stamens, and a 4 to 5 lobed germen, with 8 or 10 nectariferous pores at the base. The species are natives of the s. of Europe, the n. of Africa, the Canary isles, and the temperate parts of Asia. They are half shrubby; and have alternate, stalked, repeatedly pinnate leaves with translucent dots, the flowers small, and in terminal corymbs. **COMMON RUE**, or **GARDEN RUE** (*R. graveolens*), grows in sunny stony places in the countries near the Mediterranean. It has greenish-yellow flowers, and glaucous evergreen leaves with small oblong leaflets, the terminal leaflets obovate. It is not a native of Britain, but is frequently cultivated in gardens. It was formerly called *herb of grace* (see *Hamlet*, act iv. scene 5), because it was used for sprinkling the people with holy water. It was in great repute among the ancients, having been hung about the neck as an amulet against witchcraft in the time of Aristotle. It is the *pēganon* of Hippocrates. Rue is still employed in medicine as a powerful stimulant, but the leaves must be used fresh, as they lose their virtues by drying. The smell of rue when fresh is very strong, and to many very disagreeable; yet the Romans used it much for flavoring food, and it is still so used in some parts of Europe. The leaves chopped small are also eaten with bread and butter as a stomachic, but they must be used sparingly, as they are acrid enough to blister the skin if much handled, and in large doses act as a narcotic poison. All their properties depend on an acrid volatile oil, which is itself used for making *syrup of rue*, 8 or 10 drops of oil to a pint of syrup; and this, in doses of a teaspoonful or two, is found a useful medicine in flatulent colic of children. The expressed juice of rue, mixed with water, and employed as a wash, promotes the growth of the hair. Some of the species found in the n. of India resemble common rue in their properties, and are used for the same purposes.

RUELLIA, a genus of plants of the natural order *acanthaceæ*, natives of tropical and subtropical parts of Asia and Australia. Some of them are very beautiful, and are common ornaments of our hot-houses. In some parts of China, especially in the province of Che-kiang, and on the mountains to the w. of Ning-po, a species of this genus, *R. indigofera*, is much cultivated for the excellent indigo which it yields. It is also a native of Assam, and is cultivated there. See Fortune's *Residence among the Chinese*.

RUFF, *Machetes pugnax*, the only known species of its genus, is a bird of the family *scholopaciidæ*, and like snipes and many others of the family, an inhabitant of marshy places. It is found in most of the northern parts of the world, migrating southward in autumn, and northward in spring. It is found in England and in Ireland, but not in Scotland, probably because there are few localities in that country suitable to it. In size the ruff is considerably larger than a snipe, and is about a foot in entire length, from the point of the bill to the tip of the tail. The tail is short and pointed. The wings are long and pointed. The legs are long and slender, the *tibia* naked for some distance above the tarsal joint. The bill is straight, rather slender, as long as the head. The neck of the male is surrounded in the breeding season with a *ruff* of numerous long feathers, whence probably the English name. The males are remarkable for diversity of colors, no two specimens being ever similar; but ash-brown prevails, spotted or mottled with black; the head, ruff, and shoulders are black, glossed with purple, and variously barred with chestnut. The female (the *revere*) is mostly ash-brown, with spots of dark-brown, much more uniform in color than the male. Their nest is usually situated on a tussock in a moist, swampy place, and is formed of the coarse grass which surrounds it. The eggs are four in number. The ruff is taken for the table in spring, but the young birds taken in autumn are very preferable. They are often fattened after being taken, and are fed on bread and milk with bruised hemp-seed. After being fattened, they are sent to market. They feed readily when quite newly caught, and fight desperately for their food, unless supplied in separate dishes, which is therefore the regular practice of the feeders, who find it also advantageous to keep them in darkened apartments. The ruff is gradually becoming scarcer in England, owing to the destruction of its favorite haunts, the fens, by drainage.

RUFFE, or **POPE**, *Acerina cernua*, a very pretty little fish of the perch family (*percidæ*), abundant in the lakes, slow rivers and ditches of many parts of the middle of Europe and of England. It is not found in Scotland. It is never more than 5 or 6 in. long. In shape it resembles the common perch, but has only a single dorsal fin. The ruffe is highly esteemed for the table. It is very easily caught, a small red worm being used as bait.

RUFFED GROUSE. See **BONASIA**, *ante*.

RUFFIN, EDMUND, 1794-1865; b. Va.; editor of the *Farmer's Register* 1833-42, and for several years president of the Virginia agricultural society. He also edited other agricultural papers, and wrote treatises on scientific agriculture. He fired the first gun of the rebellion at fort Sumter Apr. 14, 1861; and committed suicide, it is said, from his aversion to living under the U. S. government.

RUFFINI, GIOVANNI, b. Italy, 1810; educated at Genoa, where he met Mazzini, whom he afterward joined in the so-called "Young Italy" organization at Marseilles. His brother Jacopo was put to death after the unsuccessful invasion of Savoy in 1834.

Giovanni escaped to England, where, with the exception of a short time in 1848, when he was Sardinian minister at Paris, he has since resided. He writes the English language remarkably well, and has published *Doctor Antonio*, 1855; *Lavinia*, 1860; and other works.

RUFFLE is a low vibrating sound, less loud than a roll, produced by drummers. It is used as a compliment to general officers and at military funerals.

RUGBY, a market t. of England, in the co. of Warwick, and 15 m. n.e. of the town of that name, is pleasantly situated on a rising ground on the left bank of the Avon, and is reached by five different railways. It derives its importance and celebrity wholly from its grammar-school, founded by Lawrence Sheriff, a London shopkeeper, in 1567. The buildings of the school, consisting of a fine Elizabethan quadrangle, with cloisters, and an elegant detached chapel, are of brick, with stone-work round the windows and at the angles and cornices. The chapel contains, among other monuments of head-masters, that of the late Dr. Arnold. The school is generally attended by about 500 pupils. The endowment of the school produces about £5,000 a year, and it offers 20 exhibitions of values varying from £40 to £80 a year, and tenable for four years. A park of 11 acres is set aside for football, cricket, and other games. The railways and the school give rise to almost all the trade of the town. Pop. '71, 7,385.

RUGBY, a colony in Tennessee, founded by a company of New England capitalists, but transferred to an English organization with a capital of £150,000, and placed under the general superintendence of Mr. Thomas Hughes, author of *Tom Brown's School Days at Rugby*. The company purchased 50,000 acres on the Cumberland plateau in Tennessee with the refusal of 350,000 more acres. The land purchased was colonized in 1880, mainly by English farmers, and was laid out in building sites, farms, parks, etc. It is situated in Morgan, Scott, Overton, and Fentress counties, and is rich in timber, minerals, water, and fertile soil. A town was laid out, a hotel built, and a road 7 m. long put under construction to connect with the Cincinnati Southern railroad. A saw-mill and brick-kiln were erected, roads and bridle-paths made, and a cricket-ground and English garden added as features of attraction. The new plan of colonization adopted was calculated to establish a permanent settlement of sons of English farmers of the better class, in fair circumstances, and with a certain degree of culture; while it also was intended to draw a considerable American representation. Its beginning has been under excellent auspices, and promises success.

RUGE, ARNOLD, b. 1802; studied in the universities of Heidelberg, Halle, and Jena. He became a member of a secret political society among the students, and for this offense was imprisoned for six years. Being released in 1830 he became a professor in the university of Halle. He had already translated the *Ceclipsus in Kolonos* of Sophocles, and had done something in dramatic composition, and in 1838 joined with Echtermeyer in founding the *Annales de Halle*, opposed to church and state. He emigrated to Switzerland, *via* France, and published his *Zwei Jahre in Paris* in 1845. In 1847 he established a book-seller's business in Leipsic; and after the revolution of 1848 published a radical journal called the *Reforme*. He was elected to the Frankfort assembly, and sat in the radical congress at Berlin. Being concerned in insurrectionary movements, he was compelled to flee to England in 1850, and after that date resided at Brighton, contributing to German literature.

RUGELEY, a market t. in the county of Stafford, on the right bank of the Trent. There are iron-works in the town, and collieries in the vicinity. Pop. '61, 4,362; '71, 3,375.

RÜGEN, the largest of the islands of Germany, belongs to Prussia, and lies in the Baltic, off the coast of Pomerania. Greatest length, 33 m.; greatest breadth, 28 m.; area, 360 sq. miles. Pop. 45,699. It is separated from the main-land, with which at one time it was probably connected, by a strait, about a mile in width. The island is so deeply indented on all sides by the sea, that it seems to be formed of several narrow tongues of land attached to each other, and to which the name of peninsulas has been given. On the peninsula of Jasmund is the precipitous cliff called the Stubbenkammer, the highest point of which (420 ft.) is called the king's seat, because Charles XII. witnessed from this spot a sea-fight between the Swedes and Danes, Aug. 8, 1715. Rügen, which until 1815 had remained Swedish territory, was in that year transferred to Prussia. Hertha lake, in this island, is believed to be the place where, according to Tacitus, the goddess Hertha (Earth) was worshiped. The soil of the island is productive, cattle are reared, and the fisheries around the island are carried on with profit. The scenery of Rügen, which is everywhere pleasing, and is frequently grotesque and romantic, together with the facilities for sea-bathing, attract numerous visitors. Chief town, Bergen, in the middle of the island, with (1875) 3,591 inhabitants.

RUGER, THOMAS H., b. N. Y., 1833; graduated at West Point. He practiced law in Wisconsin 1856-61, when he entered the army. He was made brig.gen. in 1863, brevetted maj.gen. for his conduct at the battle of Franklin, and commanded the department of North Carolina till 1866, when he was appointed col. in the U. S. infantry. He was superintendent of West Point 1871-76.

RUGGLES, SAMUEL BULKLEY, LL.D., b. Conn., 1800; graduated at Yale college in 1814, and studied law, being admitted to practice at the New York bar in 1821. In 1838 he was elected a member of the state legislature, and the following year was made a canal commissioner, being president of the canal board in 1840, and again in 1858. In 1867 he was a U. S. commissioner to the Paris exposition, and represented the United States in the international monetary conference in that city. He was also a representative to the statistical conference at the Hague in 1869, and has since acted in a similar capacity at various international meetings of the same character. An active and industrious member of the N. Y. chamber of commerce, Mr. Ruggles has devoted himself with great assiduity and established accuracy to the collection of valuable statistics concerning productions, transportation, etc.

RUGGLES, TIMOTHY, 1711-95; b. Mass.; graduated at Harvard 1732; studied law and practiced at Sandwich and Hardwick. In 1755 he was second in command at the battle of Lake George. He held successively the positions of judge of the common pleas court, chief-justice of the state, and speaker of the assembly; and in 1765 was a delegate to the New York stamp act congress, refused to concur in its resolutions, and, as a royalist, took refuge in Nova Scotia, where he founded the town of Digby.

RUHNKEN, DAVID, b. Jan. 2, 1723, at Stolpe, in Pomerania; received his academical education first at the Königsberg gymnasium, where he distinguished himself not only in classical learning, but even in music and drawing, and afterward at Wittenberg university, where he spent two years in the assiduous study of ancient literature, history, and jurisprudence. He graduated 1743; after which he went to Leyden, where for six years he prosecuted his classical studies under the guidance of Hemsterhuis, and bestowed particular attention on the Greek writers, nearly all of whom he read. He devised a new edition of Plato, collected the scholia of that author, and published an excellent edition of Timæus's *Lexicon Vocum Patonicarum* (Leyd. 1754; re-edited in a much improved form, 1789). He went in 1755 to Paris, where, for a whole year, he examined the MSS. of the royal library and of the library of St. Germain. Hemsterhuis then got him appointed as lector (reader) in the university of Leyden, in which capacity he was the assistant and colleague of his great master. In Oct., 1757, he introduced his series of lectures by a discourse, *De Græcia Artium et Doctrinarum Inventrice* (Leyd. 1757). For four years he discharged the duties of his office with a skill and success that raised him in public esteem, as one of the most learned men in Holland. In 1761 he succeeded Oudendorp in the chair of eloquence and history. In 1767 he lost his friend and master Hemsterhuis; and in his capacity as rector of the university, delivered a splendid tribute to the deceased in his *Elogium Tiberii Hemsterhusii* (Leyd. 1768). In 1774 he succeeded Gronovius as librarian to the university, which he enriched with a multitude of valuable books and MSS. He died May 14, 1798, and in gratitude to his memory, the city of Leyden purchased his great library, and gave his widow an annuity of 500 florins.

Ruhnken will long be remembered as one of the best scholars and critics of the 18th century. His fine taste and sagacity, aided by an astonishing memory and vast learning enabled him to illustrate the authors of antiquity with wonderful success. He was also a brilliant preceptor, for which he was no doubt indebted to the extreme lucidity and grace of his Latin style. A list of his works would occupy much space. In addition to those already noted, we may mention his edition of vol. ii. of Alberti's *Hesychius*; his edition of *Rutilius Lupus*; of *Velleius Paterculus*; of *Muretus*, etc. He contributed to the editions of the classics by other scholars, such as *Ernesti* and *Schweighäuser*, and thereby accumulated a vast amount of valuable material in the shape of correspondence and miscellanea. His life has been written by his famous pupil *Wytenbach* (Leyd. 1799; new and improved edition, Leips. 1822, and Freiberg, 1846).

RUHR, a river of Prussia, an affluent of the Rhine, rises about a mile from Winterberg, in the e. of Westphalia, and flowing in a w.n.w. direction, enters the plain of the Rhine at Mühlheim, and joins the great river at Ruhrort, 2 m. n.w. of Duisburg. Entire length 143 miles.

RUHRORT, a small t. of Rhenish Prussia, on the right bank of the Rhine, 63 m. n.e. of Aix-la-Chapelle by railway. It has the best harbor on the lower Rhine, possesses many large ship-building docks, is the seat of an immense coal-trade with Holland—the coal being derived from large beds of the mineral on the banks of the Ruhr—and carries on a large carrying-trade in corn, timber, and wool, and in miscellaneous articles. A large fleet of steamers, with passengers and traffic, ply from Ruhrort up to Strasburg, and down to Holland. A railway crosses the Rhine here, and passengers and goods are carried across the river in the carriages, and without being put to the trouble of shifting their seats, by means of a large steamer, the deck of which is fitted with rails. On each side of the river is a tower, 120 ft. high, connected with the railway, and furnished with a powerful engine, by means of which the railway carriages are lowered to the water on one side, and lifted to the railway on the other. Pop. '75, 9,053.

"RULE BRITANNIA," one of the national anthems of Great Britain, which has been described by Southey as "the political hymn of this country as long as she maintains her political power." Its original appearance was in a mask entitled *Alfred*, the words by

James Thomson the poet, and David Mallet, and the music by Dr. Arne, which was performed for the first time on Aug. 1, 1740, before Frederick prince of Wales, at his residence at Cliefden. The words of the ode are believed to be the composition of Mallet. *Alfred* was altered by Mallet in 1751, when three stanzas of *Rule Britannia* were omitted, and three others, by lord Bolingbroke, substituted for them; but it is the ode in its original form that has taken root.

RULE NISI, in the English and Irish courts of law, is a technical term denoting the first step in an interlocutory application to the court, such as an application for a new trial. The usual course is for the party who takes the initiative to move, *ex parte*, for a rule nisi, i.e., an order of the court that something shall be done, *unless* the opposite party, within a certain time, usually three or six days, show cause, i.e., some good reason why the thing proposed should not be done. When the party obtains a rule nisi, he sends a copy of it to the other party, who must then, at the time appointed, show cause, and if the cause is deemed sufficient, the rule is discharged, i.e., the application is refused; if the cause is insufficient, the rule is made absolute, i.e., the opposite party is bound to do the thing asked, otherwise he will be liable to some disadvantage or to imprisonment, according to the nature of the subject matter.

RULE OF FAITH, the name given in polemical theology to what is regarded as the code from which the faith of Christians is to be drawn. One of the most vital of modern religious controversies is that which turns upon the question: What is the Christian rule of faith? We can but undertake to state the conflicting views. The reformers, as a body, laid it down as a first principle, that the word of God alone, by which they meant the written word, or the Scriptures, could safely be accepted as a rule of faith. If the fathers could be received at all, it is only in the light of witnesses, and fallible witnesses, to the ancient interpretation of the Scriptures. This doctrine appears to be much modified in the English church of the Laudian period, and by the successors of that school, the modern Tractarians, who admit the "consent" of the fathers as an authoritative interpretation of the Scriptures. Roman Catholics, on the contrary, while they admit that God's word alone is the rule of faith, yet contend that the Scriptures are not to be considered as the only depository of God's word. Much of our Lord's teaching to his apostles was not committed to writing in these authentic Scriptures; and as the teaching of Christ, wherever found, is God's word, even as much as what is written in the Scriptures, they hold that if it be possible to find such teaching elsewhere than in the Bible, the teaching so found is to be held as part of the rule of faith. Now they hold that the traditions of the church, contained in the writings of the fathers, the decrees of councils, the decretals of popes, are a depository of Christ's teaching, less accessible, it is true, but when unanimous, not less certain than the Scripture itself; and of this certainty of such unanimous interpretation, they regard the church as at all times the authoritative expositor.

Protestants acknowledge the authority of the oral teaching of Christ himself, and of his apostles, or others speaking by inspiration; but in respect of the want of any authoritative or trustworthy record, they deny that any such teaching, not recorded in the Scriptures, is of any value to us. As to the right of the church to expound authoritatively, they deny it altogether.

RULE OF THE ROAD. This phrase includes the regulations to be observed in the movements of conveyances either on land or at sea.—*On land*: drivers and riders keep the side of the road next their left hand when meeting, and that next their right when overtaking and passing other horses or conveyances. The person neglecting this rule is liable for any damage that may happen through such neglect. A man riding against a horse or a conveyance driving against another that is standing still, is answerable for any damage that may ensue.—*At sea*: vessels meeting from opposite directions *port their helms* and pass one another on their left sides. A vessel overtaking another shall keep clear of that overtaken. When two sailing-vessels are crossing one another, the one that has the wind on its *port* (left) side has to keep clear of that which has the wind on the *starboard* (right) side, except when the former is *close-hauled*, and the latter free. If they have the wind on the same side, the ship that is to windward must keep clear of that to leeward. A steamer having another on her starboard side has to keep out of its way. Steamers have to keep out of the way of sailing-ships, and to slacken speed when nearing other vessels. When one vessel has to get out of the way, the other keeps her course; but safety being the first consideration, these rules are not to be acted upon at all hazards, when their observance incurs obvious risk of danger. For further details and the rules regarding ship's lights, see McCulloch's *Dictionary of Commerce*, art. "Collision."

RULE OF THE ROAD (*ante*), in the United States, is precisely the opposite of that in England, in that two vehicles meeting turn to the right instead of to the left, and it has been held that this rule does not apply to equestrians or foot-travelers. Moreover, it is conceded that circumstances may justify drivers in violating the rule, the controlling principle being that due care and diligence must be used under the special circumstances of each case. In regard to the course to be pursued at sea and as to lights and fog-signals, see NAVIGATION, LAWS AS TO (*ante*)

RULE OF THREE is the technical term for that rule in arithmetic, otherwise called proportion (q.v.), which teaches the finding of a fourth number proportional to *three given numbers*. The term "rule of three" has been in use from the commencement of the 16th c.; and from the great utility of the operation in commercial transactions, it received, almost from the commencement, the name of the Golden Rule (q.v.). To the ordinary "rule of three" was added the *backer rule*, or "rule of three inverse" (corresponding to inverse or reciprocal [q.v.] proportion), and the "double rule of three," in which two or more ratios are given as determining the number to be found.

RUM, a mountainous island of Argyleshire, belongs to the group of the Inner Hebrides, 15 m. n.n.w. of Ardnamurchan Point. It is 8 m. long, about $7\frac{1}{2}$ m. broad; area upwards of 20,000 acres, only about 6 per cent of which is under cultivation. Pop. '51, 162; '71, 81. The island is a mass of high sharp-peaked mountains, rising in Ben More to the height of 2,320 feet.

RUM, a kind of spirit made by fermenting and distilling the "sweets" that accrue in making sugar from cane-juice. The scummings from the sugar-pans give the best rum that any particular plantation can produce; scummings and molasses, the next quality; and molasses the lowest. Before fermentation water is added, till the "set" or wort is of the strength of about 12 per cent of sugar; and every ten gallons yields one gallon of rum, or rather more. The flavor of rum depends mainly on soil and climate, and is not good where canes grow rankly. Pine apples and guavas are at times thrown into the still, but on the great scale, no attempt is made to influence flavor artificially. The finest-flavored rums are produced by the old-fashioned small stills. The modern stills, which produce a strong spirit at one operation, are unfavorable to flavor. The color of rum is imparted after distillation by adding a certain proportion (varying with the varying taste of the market) of caramel, or sugar melted without water, and thus slightly charred. Rum is greatly improved by age, and old rum is often very highly prized; at a sale in Carlisle in 1865, rum known to be 140 years old sold for three guineas per bottle. It forms a very important part of our colonial produce: the quantity imported into Britain in 1875 was 8,815,681 gallons (home consumption, 5,361,486), valued at £1,014,456. Rum is distilled both in the East and West Indies.

RUMA, a small t. of Austria, in Slavonia, on an affluent of the Save, 35 m. n.w. of Belgrade. The chief industry is wine-culture, and the rearing of horses. Pop. '69, 7,771.

RUMANIA. See ROMANIA and MOLDAVIA.

RUMFORD, BENJAMIN THOMPSON, Count, an American inventor, was b. at Woburn, Mass., Mar. 26, 1753. Having received the rudiments of education at a common school, he entered a merchant's office at Salem, at the age of 13, and got his living as a clerk and school teacher, while he studied medicine and physics. In 1770 he was engaged as teacher of an academy at Rumford, now Concord, the capital of New Hampshire; and in 1772 married a rich widow of that place, and was made maj. of militia by the English governor. The jealousy of officers over whom he had been promoted, and charges of disaffection to the royal cause, at this period of the outbreak of the American revolution, drove him from Rumford to Boston, where he became acquainted with gen. Howe; and when gen. Washington compelled the surrender of Boston, Thompson was sent to England as bearer of dispatches. In London he so won the favor of the government by his intelligence as to be appointed under-secretary of state in the colonial office. On a change of ministry, however, he returned to America, and fought in the royal cause. When it failed, he entered the service of the king of Bavaria, by whom he was knighted; and in 1784 he was settled at Munich as aid-de-camp and chamberlain to the reigning sovereign. In this post he exhibited the energy of his mind and the fertility of his invention. He reorganized the army and improved its tactics. In 1790 he suppressed beggary throughout the kingdom, took measures for improving the breeds of horses and cattle, and laid out a park for Munich. He rapidly rose to the offices of maj.gen., counselor of state, lieutenant-gen., minister of war, and was created count of the holy Roman empire, when he chose Rumford, where his fortunes had begun, as his titular designation. In 1795 he visited London, where he was treated with much attention, and finding that his opinion was sought after on technological subjects, he published the results of his experience and the records of his labors in Bavaria. Having long and carefully studied the phenomena of heat, he set himself to devise a remedy for the smoky chimneys, which were one of the greatest nuisances at that time in England; and discovered the principles upon which fireplaces and chimneys have since been constructed. Other cases in which greater economy of the application or production of heat could be obtained, as cooking-ranges, stoves, etc., engaged much of his attention. On his return to Bavaria he was appointed president of the council of regency, and soon after, minister plenipotentiary to the court of St. James; but the British government, holding to the doctrine of inalienable allegiance, refused to recognize him in that capacity. He declined an invitation to revisit America, where he was greatly admired, in spite of his loyalty. He finally settled in Paris; devoted himself to improvements in artillery and illumination; founded a professorship in Harvard college, of the application of science to the arts of living; married the widow of Lavoisier; and died at Auteuil, near Paris, Aug. 21, 1814, after making many important bequests to the royal society of

London, the American academy of sciences, and Harvard university. See *Memoir* by Ellis (1876).

RUMILI. See ROUMELIA.

RUMINANTIA, in the zoological system of Cuvier, and of almost all recent naturalists, the name given to an order of mammalia called *peccora* by Linnaeus, an extremely well-defined natural order, among the individuals of which the habit of *rumination* or chewing the cud is universal and almost peculiar. The ruminantia are all strictly and exclusively herbivorous, and exhibit a great similarity of structure. They have no incisors in the upper jaw, the front of which is occupied by a callous pad. "The grass is collected and rolled together by means of the long and movable tongue; it is firmly held between the lower cutting teeth and the pad, the cartilaginous upper lip assisting in this; and then, by a sudden nodding motion of the head, the little roll of herbage is either torn or cut off, or partly both torn or cut."—Youatt. In the lower jaw there generally appear to be eight incisors; but the two outer are more properly to be regarded as canines, and in the *camelidae* they assume the ordinary canine form. Some of the ruminantia have canine teeth in the upper jaw, and some are destitute of them. In front of the molar teeth there is a long vacant space in both jaws. The molars are six on each side in each jaw; their surface exhibits crescent-shaped ridges of enamel. The head is elongated, the neck is always of considerable length, the eyes are placed at the side of the head, and the senses of smell and hearing, as well as of sight, are extremely acute. The head is in many ruminantia armed with horns, which in some are found in both sexes, in some only in the male, whilst in others they are wholly wanting; and the absence of them characterizes varieties of some species, as the sheep and ox, in which they are ordinarily present. The horns differ very much in different families, even in their structure, some being hollow (true *horns*), some solid (*antlers*). All the four limbs are terminated by two large toes, which are hoofed. Behind the hoof are always two small spurs, rudimentary toes. The metacarpal and the metatarsal bones are united into one, called the *cannon* bone. The legs are rather long, and the spinal column is very flexible. The brain of the ruminantia is small, and they do not exhibit much intelligence; nor are they distinguished by any remarkable instincts; and though easily tamed, they are scarcely susceptible of any kind of training or education. Very few, however, of the numerous species of ruminantia have been truly domesticated, and probably much is yet to be done in this way.

The ruminantia are generally gregarious; they are distributed over almost the whole world; but none are natives of Australia. They are found both in the warmest and the coldest regions. The flesh of all the ruminantia is fit to be used for human food; the fat (tallow) hardens more on cooling than the fat of other animals, and even becomes brittle. The fat, hide, horns, hoofs, hair, bones, entrails, blood, and almost all parts are useful to man.

The intestines are long in all the ruminantia. The cæcum is also long. The complex stomach, adapted to rumination, requires a more particular description. The stomach consists of four distinct bags or cavities. The first of these, into which the gullet or oesophagus enters, is, in the mature animal, by far the largest, and is called the *paunch* (Lat. *rumen*). Into this the chief part of the food passes. It is lined with a thick membrane, presenting numerous prominent hard papillæ, secreting a fluid in which the food is soaked. The second cavity is the *honey-comb bag* (Lat. *reticulum*), so called from its being internally covered with a net-work of cells, like those of a honey-comb. In Scotland it is known as the *king's hood*. This second cavity, or stomach, has also a direct communication with the oesophagus, and fluids seem in general to pass immediately into it, but sometimes or partly also into the other cavities; and it is here that the cells for retaining water are chiefly found in the camel. The third cavity, or stomach, is the *mamplies* (Lat. *psalterium*), so called because its lining membrane forms many deep folds, like the leaves of a book, beset with small hard tubercles. This also communicates directly with the oesophagus, by a sort of prolongation of it. The leaves of the membrane seem to serve for the absorption of superfluous fluid from the food. Finally, the food passes into the fourth cavity, which is of a more elongated form than any of the others, and is next in size to the first. This is called the *reed* or *rennet* (Lat. *abomasus*). It may be considered as the true stomach, homologous—if any one of the four parts can be so regarded—to the simple stomach of mammals in general. It is lined with a velvety mucous membrane in longitudinal folds. It is here that the gastric juice is secreted. In young animals it is the largest of the four cavities, and it is only when they pass from milk to crude vegetable food that the paunch becomes enlarged, and all the parts of the complex stomach come fully into use. It seems to be by a power of what may be called instinctive volition that the animal directs what passes through the gullet into the first cavity, the second, or even the third. It has been found by M. Flourens, who made many experiments on this subject, that the food consumed by ruminants passed chiefly into the first cavity, but part of it also at once into the second, and even, when it was given in a *mashed* or in a much comminuted state, into the third.

The particular means by which hastily swallowed food is brought from the paunch, formed into pellets at the base of the oesophagus, and brought up into the mouth for rumination, or second and more thorough mastication, are not yet very thoroughly

understood, notwithstanding the patient investigations of M. Flourens. He ascribes the formation of the pellets, however, to the action of the muscular duct which connects the esophagus with the second and third stomachs, and the power which the animal has of closing or opening at will the orifices of these cavities.

Cheewing of the cud is very generally performed in an attitude of repose, and evidently affords great pleasure to the animal.

The ruminantia are arranged by naturalists in seven families, all very natural—*camelidae* (see CAMEL), *muschidae* (see MUSK), *cervidae* (see DEER), *camelopardidae* (see GIRAFFE), *antelopeidae* (see ANTELOPE), *bovidae* (q.v.), and *capridae* (q.v.). The most important genera and species are separately noticed.

RUMP PARLIAMENT. In order to bring about the condemnation of Charles I., Oliver Cromwell, on Dec. 6, 1648, sent two regiments, under the command of col. Pride, to coerce the house of commons. Forty-one members of the "long parliament" who were favorable to accommodation were imprisoned in a lower room of the house, 100 were ordered to go home, and only 60 of the most violent of the independents were admitted. The clearance was called *Pride's purge*, and the privileged members ever afterward passed by the name of the *rump*, forming, as it were, the rag-end of the "long parliament." This assembly, in conjunction with the army, brought about the arraignment, trial, and condemnation of Charles I. Five years later the "rump parliament," forgetting that it was but the creature of the army, attempted to make a stand against certain demands on the part of the soldiers. The result was that Cromwell filled the house with armed men; the speaker was pulled out of the chair, the mace taken from the table, the room cleared, the door locked, and the parliament declared to be dissolved. Supreme in the three kingdoms, Cromwell convoked an assembly which assumed the title of parliament, and acquired from the name of one of its most prominent members, a leather-seller, called Praisegod Barebones, the name of the *Barebones parliament*. The Barebones parliament, after subsisting five months, was dissolved, and Cromwell, raised to the dignity of protector, convoked two parliaments, and dissolved them for refusing to sanction his measures. On Oliver Cromwell's death, and Richard's succession to the protectorate, the military malcontents, coalescing with the independents in Richard's parliament, declared the expulsion of the rump illegal, and restored that assembly to its functions. With the revival of the rump, its quarrel with the army revived; and the troops, again surrounding Westminster hall, expelled it on Oct. 30, 1659, a provisional government of officers assuming the direction of affairs. But the general dissatisfaction having led to a coalition between the Presbyterians and royalists, the army, unable to carry on the government, was reduced to the necessity of once more restoring the rump, which had been twice ignominiously expelled. The advance of Monk, however, with the army of Scotland led to a general cry throughout the country for a free parliament. A number of the members who had been excluded by Pride's purge reappearing in the house, placed the independents in the minority; and on Mar. 16, 1660, the despised and derided rump at last solemnly decreed its own dissolution. The most prominent members of the rump parliament were Vane and Hazlerig.

RUMSEY, JAMES, 1748-92; b. Md.; studied mechanics and machinery, and became an inventor. In 1784, 23 years before Fulton built the *Clermont*, Rumsey exhibited on the Potomac, in the presence of Washington, a boat propelled by machinery. In 1786 he exhibited a boat in which a pump worked by steam-power drove a stream of water from the stern, and thus furnished the motive-power. A society was formed to aid his project, of which Franklin was a member. He visited and gave exhibitions in England, and obtained patents for his invention in Great Britain, Holland, and France. His death occurred while he was preparing for further experiments. He also made improvements in mill machinery, and in 1788 published a *Short Treatise on the Application of Steam*.

RUM SHEBUB, a liqueur in which the alcoholic base is rum, and the other materials are sugar, lime or lemon juice, and the rind of these fruits added to give flavor. Almost every maker has his own receipt, and much credit is assumed by each for his own special mixture.

BUNCORN, a thriving market and manufacturing town and river-port of Cheshire, on the left bank of the Mersey, 12 m. s.e. of Liverpool. There is a station of the Northwestern railway on the Lancashire side of the river, and the town is the terminus for the Bridge-water and the Mersey and Irwell canals. It is a free port, has a custom-house, and contains iron-foundries, soap and chemical works, ship-building yards, etc.; and in the vicinity are collieries, and slate and freestone quarries. Large quantities of freestone are shipped for distant ports. In 1864, 4,566 vessels, of 278,000 tons, entered and cleared the port. Pop. '51, 8,049; '61, 10,434; '71, 12,443.

RUNEBERG, JOHANN LUDWIG, 1804-77; b. Finland; graduated at the university of Abo; in 1842 appointed professor of Greek literature at the gymnasium of Borgo. His writings are in the Swedish language, and mainly lyrical, though his drama *Kungarne Pa Salamis* (1863) is a work of merit. His idyls and versified stories are popular throughout Norway, Sweden, and Denmark. His most famous work is *Fänrik Stols Sägner* (1844), ballads on the war between Russia and Sweden.

RUNES, the earliest alphabet in use among the Teutonic and Gothic nations of northern Europe. The exact period of their origin is not known. The name is derived from the Teutonic *rán*, a mystery, whence *runa*, a whisper, and *helrán*, divination; and the original use of these characters seems to have been for the purposes of secrecy and divination. The resemblance which some of the runic characters bear to the Phœnician alphabet and others derived from it, has led to the supposition that they were first introduced by Phœnician merchants who traded with the coasts of the Baltic; and while the mass of the people were allowed to possess but a very partial acquaintance with them, the priests systematized them and retained a full knowledge of them in their own hands, no doubt finding them useful in establishing a reputation for superior power and intelligence. Scandinavian and Anglo-Saxon tradition agree in ascribing the invention of runic writing to Odin or Wodin. The countries in which traces of the use of runes exist include Denmark, Norway, Sweden, Iceland, Germany, Britain, France, and Spain; and they are found engraved on rocks, crosses, monumental stones, coins, medals, rings, brooches, and the hilts and blades of swords. Runic letters were also often cut on smooth sticks called *rún-stafas*, or mysterious staves, and used for purposes of divination. But there is no reason to believe that they were at any time in the familiar use in which we find the characters of a written language in modern times, nor have we any traces of their being used in books or on parchment. We have an explanation of the runic alphabet in various MSS. of the early middle ages, prior to the time when runes had altogether ceased to be understood.

The systems of runes in use among the different branches of the Teutonic stock were not identical, though they have a strong general family likeness, showing their community of origin. The letters are arranged in an order altogether distinct from that of any other alphabetical system, and have a purely Teutonic nomenclature. Each letter is, as in the Hebrew-Phœnician, derived from the name of some well-known familiar object, with whose initial letter it corresponds. Runes being associated in the popular belief with augury and divination, were to a considerable extent discouraged by the early Christian priests and missionaries, whose efforts were directed to the supplanting of them by Greek and Roman characters. But it was not easy suddenly to put a stop to their use, and we find runes continuing to be employed in early Christian inscriptions. This was to a remarkable extent the case in the Anglo-Saxon kingdoms of Northumbria, Mercia, and East Anglia, where we have traces of runic writing of dates varying from the middle of the 7th to the middle of the 10th century. Its continued prevalence in this particular district has been accounted for by the fact that, after the death of Edwin and the flight of St. Paulinus, the restoration of Christianity in Northumbria was effected by missionaries of the Irish school, whose predecessors had adopted the policy, not, like Augustine and his brethren, of destroying the monuments of pagan antiquity, but of allowing them to remain, and consecrating them by marking them with the symbols of Christianity. Runes are said to have been laid aside in Sweden by the year 1001, and in Spain they were officially condemned by the council of Toledo in 1115.

The different systems of runes, all accordant up to a certain point, have been classed as the Anglo-Saxon, the German, and the Norse, each containing different subordinate varieties. The Norse alphabet is generally considered the oldest and the parent of the rest. It has 16 letters corresponding to our *f, u, th, o, r, k, h, n, i, a, s, t, b, l, m, y*, but has no equivalent for various sounds which existed in the language, in consequence of which the sound of *k* was used for *g, d* for *t, b* for *p*, and *u* and *y* for *e*: *o* was expressed by *au*, and *e* by *ai, i, or ia*; and the same letter otherwise was made to serve for more than one sound. Other expedients came, in the course of time, to be employed to obviate the deficiency of the system, as the addition of dots and the adoption of new characters. But the runic system received a fuller development among the Germans and Anglo-Saxons, particularly the latter, whose alphabet was extended to no fewer than 40 characters, in which seem to have been embraced, more nearly than in any modern alphabets, the actual sounds of a language. Till recently the Norse runes had been most studied; but of late the Anglo-Saxon have become the subject of considerable attention. The table on the opposite page exhibits the best-known forms of the Anglo-Saxon, German, and Norse runic alphabets, with the names and the power of the several letters. The Anglo-Saxon runes, as here given, are derived from a variety of MS. authorities, the most complete containing forty characters, while some only extend as far as the twenty-fifth or twenty-eighth letter. Neither the name nor the power of some of the later letters is thoroughly known, and they are without any equivalents in the Norse runic system. The German runes are given from a MS. in the conventual library of St. Gall in Switzerland. Though the various runic alphabets are not alike copious, the same order of succession among the letters is preserved, excepting that, in the Norse alphabet, *laugr* precedes *madr*, although we have placed them otherwise, with the view of exhibiting the correspondence of the three systems. The number of characters in the Anglo-Saxon alphabet is a multiple of the sacred number eight; and we have the evidence both of a Swedish bracteate containing twenty-four characters, and of the above-mentioned St. Gall MS., that there was a recognized division of the alphabet into classes of eight letters—a classification which forms the basis of a system of secret runes noticed in that MS. Of these secret runes there are several varieties specified: in particular 1. *Iis-runa* and

Lago-runa (of which specimens exist in Scandinavia), consisting of groups of repetitions of the character *uis* or *lago*, some shorter and some longer, the number of shorter charac-

and a well-regulated government. His widow took charge of the administration, and attempted by every means in her power to render her son effeminate, but Runjeet-Singh's character was not capable of being weakened by such treatment. When about 17 years old his mother died suddenly (poisoned, as it is reported, by her son), and he immediately assumed the government. Runjeet-Singh now showed himself to be a prince of overwhelming ambition, and capable of attaining his object either by policy and address, or by force. In 1799, having rendered important service as an ally to Zeman Shah of Afghanistan, who had invaded the Punjab, he received from that monarch liberty to take possession of Lahore, which he accordingly did, and held it, despite the utmost efforts of his brother sirdars. To these quarrelsome neighbors he next turned his attention, and succeeded in subduing some and rendering others tributary, so that by 1809 he had greatly reduced their number. His successes having alarmed the Sikh chiefs, situated between the Sutlej and the Jumna, they besought the governor-general's interference, and this was the only occasion on which he ever came into collision with the British. Arrangements were amicably made, and Britain gave up all pretension to interference north of the Sutlej, on condition that that boundary should be carefully respected. Runjeet-Singh, thus freed from the only danger he feared, pursued his schemes of aggrandizement; and in 1812, having compelled all but three of the Punjab sirdars to resign their authority, he organized the whole under one sovereignty, and proclaimed himself *rajah*. His army had for several years previously been organized and disciplined according to the European fashion by English officers who had entered his service, so that the wild and undisciplined troops of the neighboring states had not a chance of successfully opposing him. About this time his capital was resorted to by two of the dispossessed rulers of Afghanistan, one of whom, Shah-Sujah, was the possessor of the celebrated *Koh-i-nûr* (q.v.), which prize Runjeet-Singh eagerly coveted, and at last obtained as the price of his assistance in recovering the throne of Cabul. In 1813 Runjeet-Singh obtained possession of Attock, took Multan by storm in 1817, and in 1819 annexed Cashmere, assuming after these exploits the title of *maharajah*. In 1822 he took into his service Allard and Ventura, two French officers who formerly served under Napoleon, and by their aid he finished the reconstruction of his army, with the view of extending his dominion to the west of the Indus. In pursuance of this scheme, he wrested (1829) from the Afghans the province of Peshawar. He had now an extensive territory, peopled by more than 20,000,000, and a well-trained army of 70,000 men, of whom 36,000 were infantry, thoroughly disciplined, and this numerous host was employed for several years in desultory wars with the Afghans. Between him and the British there was always a mutual distrust, dissembled by the show of extreme cordiality; but as both parties scrupulously abstained from any cause of offense, pacific relations were never interrupted. In 1836 his army was totally defeated by the Afghans, but this reverse seems not in the slightest degree to have affected the stability of his rule, even in the most recently acquired districts; and, strange to say, his long reign was not disturbed by a single revolt. He died June 27, 1839. Runjeet-Singh is one of the most remarkable men in eastern history; in person he was short and slight; his countenance, deeply marked with small-pox (which had deprived him of the sight of one eye), was, however, expressive of strong determination, to which the calm of his brilliant dark eye lent additional effect. He was totally uneducated; could neither read nor write; yet the indefatigable energy of his administration, and his clemency and moderation (rare qualities in an Asiatic despot), are without a parallel in the east. See *English Cyclopædia*; Cuvillier-Fleury, *Notes Historiques sur le Général Allard*; *Revue Britannique*, vols. x., xiii., xxiii., and xxvii.

RUNKLE, JOHN DANIEL, PH.D., LL.D., b. New York, 1822; studied and taught school, and entered the Lawrence scientific school, Cambridge, 1848; was employed, 1849, as assistant in the preparation of the *American Ephemeris and Nautical Almanac*; graduated from the scientific school, 1851. He published valuable astronomical tables in the *Smithsonian Contributions*. He was the founder of the *Mathematical Monthly*, which he edited in 1859-61. In 1865 he accepted the chair of mathematics and analytic mechanics in the Massachusetts institute of technology, Boston; was acting president, 1868, and president 1870.

RUNNELS, a co. in w. central Texas; drained by the Colorado and Red Fork rivers; 1000 sq. m.; in the census of 1870 returned as having no pop.; in '80, 980—380 of American birth, 13 colored. There is some stock-raising. Co. seat, Runnels.

RUNNER (*flagellum*, a whip), in botany, is a long slender branch proceeding from a lateral bud of a herbaceous plant with very short axis, or in popular language, without stem. It extends along the ground, and produces buds as it proceeds, which often take root and form new plants. Strawberries afford a familiar example. Another is found in *potentilla anserina*. Runners are common in the genus *ranunculus*.

RUNNERS. See KIDNEY BEAN.

RUNNIMEDA, a long stretch of green meadow, lying along the right bank of the Thames, from which it is partly concealed by plantations of willows, 20 m. w.s.w. of London. It is proposed to derive the name from the Sax. *rhynes*, water-brooks, which abound in these meadows; others suppose the word to be *runningmead*, referring to the horse-races which appear to have been held here from time immemorial, and which

still take place in the month of August. Runnimeed is of great historical interest, from the fact that Magna Charta was signed by king John, June 15, 1215, either on this meadow, or on Charter island, lying a short distance off the shore. The great charter itself professes to have been signed *per manum nostram in prato quod vocatur Runnimeed*. See MAGNA CHARTA.

RUNRIG LANDS, a peculiar species of property known in Scotland, by which alternate ridges of land belong to two individuals respectively. The origin of holding lands in this way is said to have arisen out of the practice of common, defense and watching, and the common plowing and laboring necessary or natural in the occupation of burgh acres and lauds near towns. Each party is absolute proprietor of his own ridge; but owing to the obstruction often caused to agricultural improvement, a mode of compulsory division or allotment of the lands was introduced by statute in 1695. This remedy, however, does not apply to burgh acres, or to patches of land less than four acres in extent.

RUPEE is the name of a silver coin current in India, of the value of 2s. English. The word is a corruption of the Sanskrit *rūpya*, from *rūpa*, shape, form, meaning, according to Pānini, a coin—not necessarily of silver—on which the shape of a man, according to the Kās'ikā commentary on this grammarian, is struck; and if this ellipsis of the word *man* is correct, as it very probably is, the word rupee would be of great numismatic interest, inasmuch as it would prove that even as early as at the time of the grammarian Pānini (q. v.) coins existed with a human figure impressed on them. The coin bearing the name of rupee was first struck by Shīr Shah, and was adopted by Akbar and his successors; it was of the weight of 175 grains troy, and was considered to be pure; but in the decline of the Mohammedan empire, every petty chief coined his own rupee, varying in weight and value, though usually bearing the name and titles of the reigning emperor. In the reign of Shah Aalam, a great variety of coins bore his name and the years of his succession, until 1773, when they were suppressed in the territories subject to the East India company, and a rupee was struck, called the Sicca rupee, with an inscription on it, which, translated, runs: "The king, Shēh Aalam, the defender of the faith of Mohammed, the shadow of the grace of God, has struck this coin, to be current through the seven climes;" and on the reverse: "Struck at Murshidabad, in the 19th year of the auspicious accession." Though rupees were coined also at Dacca, and finally only at Calcutta, and also at various dates, the place of coinage (the mint of Murshidabad) and the date just named (the 19th of Shah Aalam's reign) remained unaltered, in order to put a stop to the practice which money-changers had introduced, of levying an arbitrary rate of discount on rupees of different places of coinage and of previous dates, without reference to any actual diminution of weight by wear. Although the Dacca rupee was thus the actual medium of exchange, the company's accounts were for a long time kept in a different valuation, or that of the *Chalani*, or current rupee, 100 Sicca rupees being reckoned as equivalent to 116 Chalani rupees. The Sicca rupee served also as a unit of weight—80 Sicca weight being equal to one *ser*, and 40 sers to one *man* or *maund* = 82 lbs. Besides the Sicca rupee, two other rupees were current in the Bengal presidency—the Benares rupee, which ceased to be struck in 1819, and the Farakhabad rupee. At Madras the rupee of the Nawabs of the Carnatic, originally struck at Arcot, and at Bombay that of the Nawabs of Surat, became the currency of the company. In 1818 the standard of the Sicca and Farakhabad rupees was altered, but their intrinsic value was unaffected, as they continued to have the same amount of fine silver. Other changes of these coins took place—of the latter in 1824, of the former in 1833; but in 1835 the coinage of the company was entirely remodeled, and a coin, thenceforth termed the company's rupee, with its proportionate subdivisions, was struck to replace all the former currencies, being of the same weight and fineness throughout, and bearing inscriptions in English, or on one face the head and name of the reigning sovereign of Great Britain and Ireland, and on the reverse the designation of the coin in English and Persian, with the words "The East India Company" in English. The latter, of course, have disappeared since India has been placed under the direct government of the English crown. The weight, intrinsic purity, and value of the British currency of these several coins were till lately.

But as silver is subject, in the London mint, to a seigniorage of nearly 6 per cent, the London mint produce of the rupee, if of full weight (11 dwts. fine), should be 1s. 11d. Owing to the depreciation of silver, the value of the rupee has fallen; the *Sicca* rupee is now quoted only at 2s.

RUPERT, PRINCE, the son of the elector-palatine Frederick V., and Elizabeth, daughter of James I. of England, was born in 1619. In 1642 he received from his uncle, Charles I. of England, a commission to command a regiment of horse at Worcester against the parliamentarians. The impetuosity with which he charged the enemy there, and in the battle of Edgehill, would have proved of greater use to the royalists had not his rashness in pursuing the wavering foe nearly counteracted the advantages which he had already gained. Subsequently, at Chalgrove, Newark, and Newbury, he was more successful; but his petulant disregard of orders, and his hasty retreat from the field of battle at Marston moor, resulted in a signal defeat, the consequences of which had a most disastrous effect upon the fortunes of the royalist party. His conduct at Naseby, and his hasty surrender of the city of Bristol, irritated the king, who forthwith deprived him of his command, and requested him to leave England without delay. In 1648, however, he was recalled and appointed to the command of the royal fleet. In this new vocation he acquitted himself with much daring and somewhat more caution, and for three years he kept his ships afloat, after escaping the blockade in which he had been held for a twelvemonth off the Irish coast by the great parliamentary admiral Blake; but in 1651 the latter attacked the prince's squadron, and burned or sunk most of his ships. With the few vessels still remaining to him, Rupert escaped to the West Indies, where, in concert with his brother Maurice, he led a buccaneering life, maintaining himself and his men by seizing upon English and other merchantmen. After a few years spent in this manner, Rupert managed to elude the vigilance of Cromwell's captains, and made good his way to France, where he remained till the restoration of his cousin, Charles II. Rupert served with distinction under the duke of York, and in concert with the earl of Albermarle, against the Dutch, and died in 1682 in the enjoyment of various offices and dignities, being a privy-councilor, a member of the admiralty, governor of Windsor castle, etc. The last ten years of his life were spent in retirement in the pursuit of chemical, mechanical, and physical researches, for which he evinced considerable aptitude. Although it is certain that he did not discover the art of engraving in mezzotinto—the real inventor of which appears to have been a German, Von Tregen, whose early works bear the date of 1642—Rupert no doubt improved the mechanical mode of the art, which he described and illustrated for the royal society of London in 1662, after he had completed several interesting engravings on the new principle. The glass bead known as prince Rupert's drop (q.v.) derives its name from the prince.

RUPERT'S LAND, so called from prince Rupert (q.v.), who was one of the founders of the Hudson's Bay company, was formerly the official designation of that extensive tract which forms the basin of Hudson's bay and strait, and is bounded on the w., s., and n. by the water-sheds of the Arctic, St. Lawrence, and Atlantic rivers. The western boundary is from Deer lake to a point a little to the w. of the Red river settlement (q.v.). In 1870 the territory held by the Hudson's Bay company was admitted into the dominion of Canada, a portion of Rupert's land falling within the province of Manitoba. The whole of the vast territory known as Rupert's Land slopes inward toward Hudson's bay, and is well supplied with navigable rivers. The mountains of this region, which are chiefly on the boundaries, are of primitive rock, and a great portion of the country is densely wooded. The soil is rich, but on account of the severity of the climate—which is not only of a generally low temperature, but exceedingly variable in summer and autumn—the cereals and other alimentary plants are not cultivated to any extent; in fact, they are only planted in the neighborhood of the trading-posts of the Hudson's Bay company (q.v.) and in the agricultural settlement on Red river, in the s.w. In the n. the vegetation and climate are those of the polar regions. The chief dependence of the inhabitants of Rupert's Land for food and clothing is on the animal kingdom, which is here most abundantly represented. Beavers are still found, and bears, otters, martens, and muskrats are abundant, their skins forming the chief commercial product of the country. There are also abundance of foxes of various colors, bears, wolves, Canadian lynxes, etc. Among the animals used for food are the wapiti, reindeer, moose, and other species of deer; the musk-ox, hares, and an immense variety of wood-fowl and other birds. The numerous rivers and lakes are abundantly stocked with fish. The population, which is scanty, is composed of British or Canadians, and aboriginal tribes.

RUPIA is a somewhat severe form of skin disease. It is characterized by flattish, distinct *bullæ* or blebs, containing a serous, purulent, or sanious fluid, which become changed into thick scabs. Several varieties of this disease have been established by dermatologists. In its simplest form, the blebs are not preceded by any inflammatory symptoms, are about an inch in diameter, and contain a fluid which is originally thin and transparent, but soon thickens, becomes purulent, and dries into brown ragged scabs, which are elevated in the center. The scabs are easily separated, and leave ulcerated surfaces, on which several successive scabs usually form before healing ensues. In a more severe form, known as *rupia prominens*, the scab projects so much in the center as to resemble a limpet-shell in form.

Rupia is a chronic disease, and is usually limited to the limbs, the loins, and the nates. It is not contagious, and generally attacks persons debilitated by old age, intemperance, bad living, or previous diseases, especially small-pox, scarlatina, and syphilis. The general treatment consists mainly in the administration of tonics, such as quinia, the mineral acids, ale, wine, animal food, etc. Some writers strongly recommend the tincture of serpentaria; and there is no doubt that certain cases which will not yield to tonics, rapidly improve when treated with iodide of potassium. The local treatment consists in puncturing the blebs as soon as they arise, in removing the scabs by poulticing, and in applying a slightly stimulating application—such as a solution of nitrate of silver—to the subjacent ulcers. The disease is frequently tedious and obstinate, but the patient almost always ultimately recovers.

RUPPIN, NEU, a t. of Prussia, in the province of Brandenburg, on a small lake of the same name, which communicates by water with the Elbe, 38 m. n. of Potsdam. It contains a castle, a lunatic asylum, and (1875) 12,501 inhabitants, who are engaged in brewing, spinning, and the manufacture of linen and woolen cloths.

RUPTURE. See HERNIA.

RURAL DEAN, an official, ordinarily a beneficed clergyman, appointed in a diocese to maintain in a certain district, called a deanery, a supervision over the condition of churches, church furniture, glebe houses, schools, the appliances of public worship, and all other things appertaining to the service, and to report on all to the bishop as occasion may arise.

RURIK, who is considered to have been the founder of the Russian monarchy, was, according to most authors, a "Varangian" of Scandinavian origin, who was invited by the Slaves of Novgorod to come and rule over them; according to others, he was the chief of a tribe of Norse colonists which was located near the gulf of Finland, and, after a long contest, succeeded in subduing the northern Slaves and some neighboring tribes of Finns; while Kostomarov attempts to prove that he was a Lithuanian. That he was either a Scandinavian or of Scandinavian origin, there seems to be very little doubt, and it is as generally maintained that, accompanied by his brothers, Sindf (Sineous) and Truvor, he, at the head of a small army, took possession of the country to the s. of the gulf of Finland, lakes Ladoga, Onega, and Beloe in 861 or 862, and laid the foundation of a monarchy. His brothers afterward settled, the one at Bielo-ozero, and the other at Izborsk; but dying without issue, their principalities were united to Novgorod by Rurik. Novgorod was made the seat of government in 864 or 865, and the various insurrections of his Slavic subjects were quenched in blood, Vadim, their leader, whose valor is celebrated by the ancient chroniclers, perishing by Rurik's own hand. To secure himself and his descendants in their newly-acquired territory, Rurik invited various colonies of Varangians to settle in the country, and after reigning peaceably from this time, he died in 879. During his reign some of the Varangians attempted a land expedition against Constantinople, but renouncing the scheme, settled on the banks of the Dnieper, and founded the little state of Kiev. The family of Rurik reigned in Russia till the death, in 1598, of Feodor, son of Ivan the terrible, when, after a brief intestine contest, it was succeeded by the newly allied house of Romanoff (q. v.). Many noble families of Russia, such as Odojefski, Obolenski, Dolgorouki, Lfot, Belosselski-Beloperski, and Gagarin, are legitimately descended in the male line from Rurik; and the princes of Romodanofski-Lady-shenski are legitimate descendants in the female line.—See prof. Thomsen's lectures on this subject (1878).

RUSA, a genus of *cervide*, or subgenus of *ceruus* (see DEER), containing a number of species of deer, natives of the forests of the East Indies, which may be described as stags with round antlers, a snag projecting in front just above the base of each, and the top forked, but the antlers not otherwise branched. They are generally of large size, and among them are some of the finest kinds of Asiatic deer. The GREAT RUSA (*R. hippelaphus*) is supposed by some to be the *hippelaphus* of Aristotle; but his description is not complete enough to identify the species. It is a native of Java, Sumatra, etc., and is about the size of a large stag, with brown rough hair, the neck with a long mane. The SAMBUR or SAMBOO (*R. Aristotelis*) of India is a similarly large and powerful animal, and no Indian deer is more sought after by European sportsmen. It also is supposed by some to be the *hippelaphus* of Aristotle. The color is sooty brown, and the male has a mane. It is solitary in its habits, and delights in low forests where water abounds. The axis (q. v.) is very nearly allied to this genus.

RUSCHENBERGER, WILLIAM S. W., b. N. J., 1807; graduated at the university of Pennsylvania, 1830. He studied medicine, became a surgeon in the U. S. navy, and was fleet surgeon of the East India squadron which circumnavigated the world. He was at the head of the naval hospital in Brooklyn for four years. In 1854 he was chief surgeon of the Pacific squadron, was made commodore, and in 1869 retired. He wrote several books of travel and many scientific articles.

RUSCUS. See BUTCHERS' BROOM.

RUSH, *Juncus*, a genus of plants of the natural order *juncææ*, having a glume-like (not colored) perianth, smooth filaments, and a many-seeded, generally 3-celled capsule. The species are numerous, mostly natives of wet or marshy places in the colder parts of

the world; some are found in tropical regions. Some are absolutely destitute of leaves, but have barren scapes (flower-stems) resembling leaves; some have leafy stems, the leaves rounded or somewhat compressed, and usually jointed internally; some have plane or grooved leaves on the stems; some have very narrow leaves, all from the root. The name rush perhaps properly belongs to those species which have no proper leaves; the round stems of which, bearing or not bearing small lateral heads of flowers, and popularly known as *rushes*, are used for plaiting into mats, chair-bottoms, toy baskets, etc. The **SOFT RUSH** (*J. effusus*) is a native of Japan, as well as of Britain, and is cultivated in Japan for making mats. In ruder times, when carpets were little known, rushes were much used for covering the floors of rooms; to which many allusions will be found in early English writers. The stems of the true rushes contain a large *pith*, or soft central substance, which is sometimes used for wicks of candles. There are 20 or 22 British species of rush, some of which are very rare, some found only on the highest mountains, but some are among the most common of plants. They are often very troublesome weeds to the farmer. Thorough drainage is the best means of getting quit of them. Lime, dry ashes, road scrapings, etc., are also useful. Tufts of rushes in pasture are a sure sign of insufficient drainage. Many marshy and boggy places abound in some of the species having leafy stems and the leaves jointed internally, popularly called *sprots* or *sprits*, as *J. acutiflorus*, *J. lamprocarpus*, and *J. obtusiflorus*. They afford very little nourishment to cattle; but are useful for making coarse ropes for ricks, etc., which are stronger than those made of hay.

RUSH, a co. in s.e. Indiana, crossed by the Cincinnati, Hamilton and Dayton, and the Jeffersonville, Madison and Indianapolis railroads; drained by the Blue river, and Flat Rock creek; 410 sq.m.; pop. '80, 19,238. The surface is mostly level, with considerable table-land, and with large forests of oak, ash, and sugar maple. The soil is fertile; the principal products are grain, hay, wool, butter, sorghum, and maple molasses; lumbering and stock raising are important industries. It contains woolen, saddlery, and wagon factories; flour and saw mills; and numerous brick-kilns. Co. seat Rushville.

RUSH, a co. in w. Kansas, intersected by Walnut creek, an affluent of the Arkansas river, and Big Timber creek in the n., a branch of the Smoky Hill river; 720 sq.m.; pop. '80, 5,490—4,186 of American birth, 5 colored. Its surface is composed of level plains, slightly undulating in the s., thinly timbered, with a fertile soil. Co. seat, La Crosse.

RUSH, BENJAMIN, M.D., an American physician, was b. near Philadelphia, Dec. 24, 1745, was educated at Princeton college, studied medicine in Philadelphia, London, Edinburgh, and Paris, and in 1769 was made professor of chemistry in the Philadelphia medical college, and became a contributor to medical literature. Elected a member of the continental congress, he advocated and signed the declaration of independence. In 1777 he was appointed surgeon-gen. and physician-gen. of the continental army. His duties did not prevent him from writing a series of letters on the constitution of Pennsylvania, which was changed by his influence. He resigned his post in the army, because he could not prevent frauds upon soldiers in the hospital stores. In 1785 he planned the Philadelphia dispensary, the first in the United States; and was a member of the convention which ratified the federal constitution. Retiring from politics, he became professor of the theory and practice of medicine in the Philadelphia medical college; and was so successful in the treatment of yellow fever in 1793 that he was believed to have saved the lives of 6,000 persons. His practice, in consequence, became so large that he prescribed for 100 patients a day, whom he saw even at his meals. Virulently attacked by Cobbett, who published a newspaper in Philadelphia, he prosecuted him for a libel, and recovered \$5,000 damages. His medical works produced honors from several European sovereigns. The chief of them were *Medical Inquiries and Observations, Diseases of the Mind, Medical Tracts, Health, Temperance, and Exercise*. In 1779 he was appointed treasurer of the United States mint, which post he held until his death in Philadelphia, April 19, 1813.

RUSH, RICHARD, 1780—1859; b. Philadelphia; son of Dr. Benjamin Rush. He graduated from the college of New Jersey 1797; studied law; was admitted to the Philadelphia bar 1800. He defended Duane, editor of the *Aurora*, charged with libel on governor McKean. Attorney-gen. of Pennsylvania 1811. In the same year he was appointed comptroller of the U. S. treasury; U. S. attorney-gen. 1814—17; secretary of state *pro tem.* under president Monroe, and minister to England; secretary U. S. treasury under president Adams. He was appointed on a number of commissions to negotiate loans, establish state lines, etc., and obtain for the U. S. government the Smithsonian legacy from England, amounting to \$515,169. He was minister to France 1847—49; retired in the latter year to private life at Sydenham near Philadelphia. In his contributions to the press he defended the war with England and opposed the U. S. bank. He compiled a new edition of the U. S. laws.

RUSH-NUT. See **CYPERUS**.

RUSHWORTH, JOHN, an English author, whose work entitled *Historical Collections of Private Passages of State, Weighty Matters in Law, and Remarkable Proceedings in Parliament*, is a most important contribution to our knowledge of the civil war and the events that led to it, belonged to an ancient family in Northumberland, and was born

there about 1607. He studied at Oxford, but left the university without taking a degree, and settled in London as a barrister. His interest in political affairs was, however, so strong that he appears to have spent a great deal of his time, for many years, in attending the star-chamber, the court of honor, the exchequer chamber, parliament, etc., and in taking down short-hand notes of the proceedings. When the long parliament met in 1640, Rushworth was appointed assistant to Mr. Henry Elsyngne, clerk of the house of commons, an office which afforded him ample opportunities for adding to his *Collections*. He rendered a variety of important services to his party during the civil war. The restoration of Charles II., in 1660, was fatal to his fortunes. Though not molested, he was one of those to whom the "cold shoulder" was shown by the triumphant royalists. In 1677 sir Orlando Bridgman, lord keeper of the great seal, appointed the old man, now (it is conjectured) in straitened circumstances, his secretary; and curious to say, we find him, two years after, a member of parliament. In 1684, when he had reached the age of 77, he was arrested for debt, and imprisoned in the king's bench, where he died in 1690. His last years were rendered doubly miserable, partly by the loss of his understanding, and partly by his addicting himself to intemperance. Rushworth's *Historical Collections* were published in four parts. The first, embracing the period from 1618 to 1629, was published in 1659; the second, embracing the period from 1629 to 1640, in 1680; the third, embracing the next five years, in 1692; and the fourth, extending to 1648, in 1701. The whole was republished in 1721. The work has been violently attacked by royalist and high church writers, as unfair, and even false, but their charges have not been substantiated.

RUSK, a co. in central Dakota, having the Missouri river for its e. boundary, drained by the Moreau river intersecting it centrally; 1600 sq.m.; pop. '80, with three other counties, 676—484 of American birth, 81 colored. Its surface is undulating, rising in the w. into the Elk Ridge mountains. In the n.e. is Grand river agency; and the Sioux reservation occupies a large proportion of the soil, which in the bottom lands is very fertile. Cottonwoods and willows grow on the river banks, and pines on the highlands.

RUSK, a co. in e. Texas, having the Sabine river for its n.e. boundary, intersected by the International and Great Northern railroad; 800 sq.m.; pop. '80, 18,987—18,838 of American birth, 8,178 colored. It is drained by the Angelina river in the s.w., and other small creeks. The surface is hilly, the larger proportion covered with good building timber. The soil is adapted to the production of corn, cotton, sweet-potatoes, dairy products, and the raising of live stock. Mineral springs are found, and extensive beds of iron ore. It has broom factories and saw-mills. Co. seat, Henderson.

RUSKIN, JOHN, the most eloquent and original of all writers upon art, was b. in London in 1819. He studied at Christ Church, Oxford, where he gained the Newdigate prize for English poetry in 1839, and took his degree in 1842. The year following appeared the first volume of his *Modern Painters*, the primary design of which was to prove the infinite superiority of modern landscape-painters, especially Turner, to the old masters; but in the later volumes (the 5th and last was published in 1860), the work expanded into a vast discursive treatise on the principles of art, interspersed with artistic and symbolical descriptions of nature, more elaborate and imaginative than any writer, prose or poetic, had ever before attempted. *Modern Painters* was essentially revolutionary in its spirit and aim, and naturally excited the aversion and hostility of the conservatives in art. But the unequalled splendor of its style gave it a place in literature; crowds of admirers and disciples sprang up; the views of art enunciated by Ruskin gradually made way; and have largely determined the course and character of later English art. In 1849 appeared *The Seven Lamps of Architecture*; and in 1851—53, *The Stones of Venice*, both being efforts to introduce a new and loftier conception of the significance of domestic architecture. They were exquisitely illustrated by the author himself. About this time *pre-raphaellism* began to develop itself as a distinctive phase of modern art, and Ruskin warmly espoused its cause. His letters to the *Times*, his pamphlet on the subject (1851), and his "Notes" on the royal academy exhibitions (1855—60), besides numerous casual expressions of opinion, bear testimony to the ardor and sincerity of his admiration. In 1854 he published four singularly pithy and ingenious *Lectures on Architecture and Painting* (previously delivered at the Edinburgh philosophical institution); and in 1858, two *Lectures on the Political Economy of Art* (previously delivered at Manchester). Works of perhaps lesser consequence are his *Notes on Turner's pictures and drawings exhibited in Marlborough house* (1857); *Elements of Drawing, in Three Letters for Beginners* (1857); *Elements of Perspective* (1859); *Unto this Last* (1862); *Study of Architecture in our Schools* (1865); *Crown of Wild Olive: Three Lectures* (1866); *The Queen of the Air, being a Study of the Greek Myths of Cloud and Storm* (1869); *Lectures on Art* (1870); *Munera Pulveris: Essays on Political Economy* (1872); *Aratra Pentilici: Lectures on the Elements of Sculpture* (1872), etc. A few years ago this prolific author started a periodical pamphlet, entitled *Fors Clavigera*, for the exposition of the multifarious application of his art-principles. From 1869 till 1879 he was Slade professor of fine arts at Oxford. In 1871 he gave £5,000 to endow a master of drawing in the Taylor galleries, Oxford. In the same year the university of Cambridge conferred on Ruskin the degree of LL.D.

RUSS, JOHN DENISON, b. Mass., 1801; educated at Yale college. He began the practice of medicine at New York in 1826, and after a residence of three years in Greece, where he established a hospital, he returned to this country, and was appointed superintendent of the New York institution for the blind. He invented an alphabet for the blind, and a simpler system of mathematical characters. He was one of the founders of the New York prison association; superintendent of the juvenile asylum 1851-58; and has taken an active part in other philanthropies.

RUSSELL, a co. in e. Alabama, having the Chattahoochee river for its e. boundary separating it from Georgia; 700 sq.m.; pop. '80, 24,840—24,793 of American birth, 18,660 colored. It is drained by Wetumpka, Uchee, and Cowkeec creeks, and intersected by the Mobile and Girard railroad. The surface is uneven, largely covered with pine timber, having productive sections interspersed with barren tracts rising into rough ridges and sinking into sandy plains. The tillable lands yield grain, sweet-potatoes, and cotton, and there is good pasture for live stock. Co. seat, Seale's Station.

RUSSELL, a co. in central Kansas, drained by the Saline and Smoky Hill rivers, affluents of the Kansas; 900 sq.m.; pop. '80, 7,351—6,171 of American birth, 34 colored. It is intersected by the Kansas Pacific railroad. Its surface spreads out into level fertile plains adapted to grain culture and stock-raising. Co. seat, Russell.

RUSSELL, a co. in s. Kentucky, intersected in the s. by the Cumberland river; 300 sq.m.; pop. '80, 7,591—7,589 of American birth, 354 colored. Its surface is hilly, timber covering the greater part. The soil under cultivation yields good crops of grain, tobacco, sorghum, and the products of the dairy. Much attention is paid to the raising of live stock. Co. seat, Jamestown.

RUSSELL, a co. in s.w. Virginia, having the Clinch mountains for its s. boundary, and the Dividing Ridge for its n., drained by Clinch river; 500 sq.m.; pop. '80, 13,906—13,901 of American birth, 1,271 colored. Its surface is diversified by fertile valleys producing grain, tobacco, wool, dairy products, flax, maple sugar, and sorghum. Live stock find excellent pasturage on the mountains, which are generally in the highest portions covered with a thick growth of maple, oak, hickory, and pine trees. Beds of iron ore, coal, and marble are found. Co. seat, Lebanon.

RUSSELL, a co. in e. Ontario, having the Ottawa river for its n. boundary; 686 sq. m.; pop. '71, 18,344. It is drained by Bear brook and Castor creek, affluents of the Petite Nation river. Its surface is level, well wooded, the soil is fertile, and it has an active lumber trade. Its courts are held in Prescott co., at the co. seat, L'Orignal.

RUSSELL, HOUSE OF. The first dukedom of Bedford (q.v.) expired in the person of the great regent of France (in the time of Henry VI.), with whom the present dukes are unconnected by affinity. The early descent of the Russells, and their derivation from the Du Rozels of Normandy, have been traced by Mr. Wiffen in his *Memoirs of the House of Russell*. This great historical family is said to derive its descent from Olaf, the sharp-eyed king of Rerik, in the 6th c., one of whose descendants, Turstain, a Scandinavian jarl, settled in Normandy, on its conquest by the Northmen, and became possessed of the barony of Briquebec, and the castle of Rozel, near Caen. In a charter of Matilda, wife of the conqueror, dated 1066, Hugh de Rozel appears as a witness, and is no doubt the same knight who accompanied William in his invasion of England, and assisted at the battle of Hastings. His name, together with that of his brother, are found on the roll of Battle Abbey. They both accompanied duke Robert of Normandy in the first crusade, where the elder died. The younger, Hugh de Rozel, upon his return from the Holy Land, established himself in England, and was the progenitor of sir James Rozel, or Russell (as it had then begun to be called), governor of Corfe Castle in 1221, and of sir W. Russell, who represented Southampton in the first parliament of Edward II. From the latter Russell directly descended sir John Russell, one of the most valiant soldiers of the age of chivalry. His son, sir John Russell, was speaker of the house of commons in the time of Henry VI. The high fortune and eminence of the house of Russell date from his grandson, JOHN RUSSELL, one of the most accomplished gentlemen of his time, who, in 1538, was elevated to the peerage, under the title of "lord Russell, baron Russell of Cheyneys, co. Buckingham." His son, the second earl, was a person of eminence in queen Elizabeth's reign, and was, like his father, a knight of the garter. The next notable member of the family was EDWARD RUSSELL, who was bred to the sea, and was groom of the bedchamber to the duke of York, afterward James II., but upon William Lord Russell's judicial murder retired from court. Strenuously supporting the revolution, he obtained high naval commands from William III., and distinguished himself as one of the most eminent naval heroes of the period, particularly by his victory over the French fleet at La Hogue in 1692. His cousin was—

LORD WILLIAM RUSSELL, son of William, 5th earl, who has left an unperishable name, as one of the most glorious martyrs of English liberty. He was born Sept., 1639; was educated at Cambridge; passed some years at Augsburg and other places on the continent, and returned to England at the restoration. In 1678-79 he was returned to parliament for the co. Bedford. His first public act was worthy of his subsequent career. He inveighed against the corruption of the Cabal, the influence of France, the

dishonorable commencement of the war with Holland, and the fraud practiced upon the bankers. He was ever afterward found conspicuous wherever the designs of the court could be traversed, or the cause of constitutional liberty befriended. He appeared publicly in the king's bench at Westminster hall, June 16, 1680, and presented the duke of York as a recusant. He also carried up to the house of lords the bill of exclusion against the duke, at the head of more than 200 members of the commons. This bill, setting forth that the duke of York was a papist, declared him incapable of succeeding to the crown. The king and duke determined to be revenged upon Russell and the other leaders of the whig party. Charged as participators in the Rye House plot (q. v.), lord Russell, the earl of Essex, and Algernon Sidney were arrested. Russell was, July 13, 1683, arraigned at the Old Bailey for high treason. Infamous witnesses easily satisfied a packed jury. As they were about to withdraw, the prisoner said: "I call heaven and earth to witness that I never had a design against the king's life." But the jury pronounced the fiat that condemned Russell to the block, and the horrible sentence of death for high treason was forthwith pronounced. The king and the duke were determined to have his blood, and to crush the leaders of the whig party. Some of the Tory ministry ventured to plead in his favor, but in vain. The earl of Bedford had gained the king's favorite, the duchess of Portsmouth, to his interest, and offered, through her, £100,000 for the life of his son. To satisfy his aged father, and at the earnest request of his afflicted wife, Russell himself petitioned the king. He solemnly disclaimed the least intention against the king's life, or the least design to change the constitution. There is reason to believe that Charles was disposed to relent, but that the duke of York insisted upon the prisoner's death, which took place July 21, 1683. The simple relation of his last hours by bishop Burnet, his intimate friend and companion, is justly considered one of the most pathetic passages in history. The murder of Russell, perpetrated for the most unconstitutional end by the most unconstitutional means, followed by that of Sidney, rendered the despotism of the Stuarts odious, and led, in the next reign, to the overthrow of the family. Russell died in the 42d year of his age, leaving a name to be remembered and revered wherever truth has a sanctuary or liberty a shrine. His attainder was annulled after the revolution. His widow, LADY RACHEL WRIOTHESLEY, second daughter and heiress of Thomas earl of Southampton, survived her lord more than forty years. She cherished the memory of her lord with the most tender recollections. She died Sept. 29, 1723, at the advanced age of 86. Her eldest son by lord Russell was WRIOTHESLEY, second duke of Bedford.

JOHN, fourth duke, was first lord of the admiralty in the Pelham administration of 1744. He became in 1756 lord-lieut. of Ireland. In 1762 he was accredited minister plenipotentiary to the court of France, and signed at Fontainebleau the preliminaries of peace with France and Spain. He was president of the council in the administration formed by Mr. Grenville in the autumn of 1763. His concern with public affairs extended over the important term comprised between the fall of the administrations of Walpole and Chatham. When first lord of the admiralty (from 1744 to 1748), he shared with Mr. Pelham, the premier, and the duke of Newcastle, the substantial power of the government. His correspondence, preserved at Woburn Abbey, and given to the world by earl Russell, contains authentic materials for the illustration of the political history of England from 1744 to 1770. The introduction to the first volume contains a brief but able historical sketch by the noble editor of the period from the administration of Walpole to 1748, and some interesting particulars of the private life and personal character of the duke. He died in 1771, and was succeeded by his grandson—

FRANCIS, fifth duke, born in 1765. He was a steady friend to the cause of popular freedom, and was regarded by his friends, among the most devoted of whom was Charles James Fox, with feelings of attachment amounting to enthusiasm. He died unmarried in 1802, and was succeeded by his brother—

JOHN, sixth duke, born 1766, father of lord John (now earl) Russell (q. v.). He died Oct. 20, 1839, and was succeeded by his eldest son—

FRANCIS, seventh duke, who, after a short career in the lower house, was summoned to the house of lords in his father's barony of Howland. He declined office, but invariably supported the views and measures of the whig governments, and in the dissensions among the whig party the political congresses at Woburn exercised great influence. He was much consulted by his distinguished brother, when first lord of the treasury, and on more than one occasion his advice on political affairs was sought by his sovereign. He was an enthusiastic patron of the turf from early life, and his stud at Newmarket was of princely dimensions. Of late years he devoted himself to the happiness of his tenantry and the comfort of the laborers on his extensive estates. He died May 14, 1861, and was succeeded by his only son—

WILLIAM, eighth duke, born in 1809. He was M.P. for Tavistock from 1832 to 1841, but was most retired in his habits, and took no active part in political affairs. He died May 26, 1872, and was succeeded by his cousin—

FRANCIS, ninth duke, born 1819, eldest son of the late maj.-gen. lord George Russell, second son of John, sixth duke. The heir-apparent to the dukedom is his son George, marquis of Tavistock.

The dukes of Bedford have a magnificent mansion and park at Woburn, near Bedford.

RUSSELL, BENJAMIN, 1761-1845; b. Boston; apprenticed to Isaiah Thomas to learn the printer's trade, served as a soldier in the revolutionary war, and at the same time corresponded for the Worcester *Spy*, published by his late master. In 1784 he became a printer in Boston on his own account, and began the publication of a semi-weekly journal called *The Columbian Centinel*, assisted by Ames, Pickering, Lowell, Higginson, and Cabot as contributors, exerting a marked influence on the public opinion of the time, and retiring from the editorship in 1828. He was one of the aldermen of the city, representative to the general court, state senator for a number of years, one of the governor's council, and in 1820 a member of the constitutional convention.

RUSSELL, DAVID ALLEN, 1820-64; b. Salem, N. Y.; son of David; graduated from West Point 1845; served in the Mexican war and in the war of the rebellion. He was in the hardest-fought battles of the war, and rose through successive grades to brig.gen.; was prominent in the battle of Fredericksburg, and in Grant's campaign from the Rapidan to the James; wounded at Rappahannock 1863. On the 2d day of the battle of the Wilderness he saved the 6th corps, and commanded the 1st division; was wounded at Cold Harbor, and transferred to the Shenandoah. He was brevetted lieut.col. for battles on the peninsula, col. and brig.gen. for Gettysburg and the Wilderness, maj.gen. for Opequan.

RUSSELL, JOHN RUSSELL, Earl, K.G., English minister and statesman, third son of the sixth duke of Bedford, was born in Hertford street, Mayfair, London, Aug. 18, 1792, educated at Westminster school, whence he was sent to Edinburgh, at that time preferred to the English universities by the great whig families. Here he pursued his studies with industry and success, under the care of prof. Dugald Stewart; and here, at the meetings of the speculative society, he first exercised his powers of debate. In 1809 he proceeded on a continental tour, and France being closed against English travelers, he directed his steps to Portugal and Spain. In 1821 appeared his *History of the British Constitution*, and in 1824, *Memoirs of the Affairs of Europe from the Peace of Utrecht*. In more recent years he compiled from the family archives and gave to the world the *Correspondence of John, fourth Duke of Bedford*, which throws much light on the secret history of the early part of George III.'s reign; the *Life, Diary, and Letters of Thomas Moore*, in pursuance of a promise made to the poet several years before; the *Correspondence of Charles James Fox*, and *Life and Times* of that great whig statesman. Having now noticed his career as an author, we may briefly pass in review his long, honorable, and consistent career as a politician. In 1813 he was elected for the family borough of Tavistock, and vigorously but vainly opposed the repeal of the *habeas corpus* act in 1817. He made his first motion in favor of parliamentary reform in 1819, and continued to bring the subject almost annually before the lower house, until he stood forward as a minister of the crown to propose the great measure of 1831. He was also the strenuous advocate of the repeal of the test and corporation acts, Roman Catholic emancipation, and other measures of civil and religious liberty. In 1828 he carried by a large majority his motion for the repeal of the test and corporation acts, although it was opposed by the duke of Wellington's government. In 1829 he supported the Catholic emancipation bill. At the general election of 1830, caused by the death of George IV., the rallying cry of parliamentary reform sent many additional liberals into the house of commons. The "great duke" was driven from office; and earl Grey being appointed prime minister, proceeded to form a cabinet pledged to peace, retrenchment, and reform. Russell did not receive a seat in the cabinet, but he was appointed to the lucrative office of paymaster of the forces, and was one of the four members of the government to whom earl Grey intrusted the task of framing the draft of the first reform bill. The great and imperishable honor next devolved upon Russell of proposing the bill (Mar. 1, 1831). The fortunes of the measure belong to the history of the time; suffice it to say, that on June 4, 1832, the bill obtained the royal assent, and that the country was saved from the throes of revolution and civil war, which at one period appeared imminent. Russell left office with the Melbourne government (which had succeeded to that of earl Grey) in Nov., 1834. In Mar., 1835, he brought forward a motion in favor of taking into consideration the temporalities of the Irish church. It was opposed by the government, but after three nights' debate, was carried by 322 votes against 289. On April 4 he carried a resolution in committee in favor of appropriating any surplus which might remain, after fully providing for the spiritual wants of the members of the Irish church, to the general education of all classes of Christians. The report of the committee having been affirmed by the whole house, the government of sir Robert Peel was dissolved, and that of lord Melbourne restored. Russell now became home secretary, with a seat in the cabinet. On June 5, 1835, he brought in an important bill for the reform of the municipalities of England and Wales, which was carried after some mutilation, and secured an effective reform of municipal institutions. Next session he proposed and carried the government plan for the commutation of tithes in England. Also a bill for a general registration of marriages, births, and deaths, the value of which, in social and statistical inquiries, can scarcely be overrated; and a bill for the amendment of the marriage laws, which enabled dissenters to be married in their own chapels. He likewise passed an English church reform bill, making a new distribution of episcopal dioceses and incomes. In 1837 he carried a series of bills for further amending the

criminal law, by which capital punishment was finally removed from forgery and all offenses except seven. An Irish tithe bill was also passed, but the "appropriation clause" being always rejected by the lords, Russell was obliged to accept the bill divested of the clause. He exchanged the seals of the home for those of the colonial office, when the Canadians broke into rebellion in 1839, and sent over lord Durlham, who recognized the right of the Canadians to self-government; and who, with his successor, lord Sydenham, brought the Canadas into loyal and harmonious relations with the mother-country, which have never since been disturbed.

In 1841 Russell proposed a fixed duty of 8s. per quarter on foreign corn, and a reduction of the duties on sugar and timber. Being defeated by the opposition, the Melbourne government appealed to the country without success; and Russell and his colleagues made way for the administration of Peel. In this general election, he challenged the verdict of the city of London upon the free-trade measures of the government, by boldly leaving Stroud, and standing for the city. He was elected by the narrow majority of nine votes, and continued to represent the city until his elevation to the peerage. In Nov., 1845, Russell wrote a letter from Edinburgh to the electors of the city of London, announcing his conversion to the total and immediate repeal of the corn laws. This letter led to the resignation of the Peel cabinet; and Russell was commissioned by the queen (Dec. 11, 1845) to form an administration, which at first he failed to do through the antipathy of earl Grey to lord Palmerston, and sir Robert Peel being recalled to power, had the honor of carrying the repeal of the corn-laws. His Irish coercion bill, however, being defeated by the combined whigs and protectionists, he resigned; and Russell became nominally what he had been really during the greater part of the Melbourne administration—prime minister. In 1846 a series of assassinations in Ireland compelled him to propose a more stringent coercion act than that of the previous session. In 1847 he had to deal with the Irish famine; and in 1848 with a miniature Irish rebellion. The papal bull, parceling England into dioceses, extorted from Russell an indignant protest, first in the form of a letter to the bishop of Durlham, and next in the ecclesiastical titles bill of 1851, prohibiting the assumption of territorial titles by Roman Catholic prelates. Russell's advice to the queen to dismiss her foreign secretary and his ancient colleague, lord Palmerston, for communicating, without consultation with his colleagues, his approval of the French *coup d'état*, precipitated the downfall of the Russell administration, and in Feb., 1852, he ceased to be first lord of the treasury. Lord Derby made an unsuccessful attempt to carry on the government; and in the succeeding cabinet of the earl of Aberdeen, Russell consented, Dec., 1852, to fill the post of foreign secretary with the leadership of the house of commons. In the session of 1854 he brought forward a new reform bill, but was most reluctantly compelled to resign it in consequence of the Crimean war. He was next appointed commissioner to the congress of Vienna, and incurred so much unpopularity by recommending terms of peace, and a plan of counterpoise suggested by Austria, that he was forced by the pressure of unfavorable opinion to leave the ministry (July, 1855). He voted against the government on Mr. Cobden's motion against lord Palmerston's Chinese policy, which led to a dissolution. When the second administration of lord Palmerston was formed (June, 1859), Russell became for the second time foreign secretary, which office he held until 1865. He threw the moral influence of his name and the nation he represented into the scale of Italian unity and independence. He uttered warnings and remonstrances against the annexation of Savoy and Nice by France, which gave great offense to the government of the emperor Napoleon by their frankness and candor. He ably preserved British neutrality in the civil war between the federal and confederate states of America. He wrote spirited dispatches expressive of the indignation with which the British government regarded the despotic acts of Russia in Poland; but he incurred many reproaches from the Poles and their sympathizers in France and England, for withdrawing from the Austrian and French alliance when war with Russia appeared imminent. More recently, he took an active but not a successful part in the Slesvig-Holstein dispute, which the peculiar policy of the French emperor brought to nothing. Russell always took a very prominent part in promoting the education of the people, and, with the assistance of lord Lansdowne, laid the foundation of the present system of national education, supported by parliamentary grants, and administered by the committee of privy council for education. He brought forward for many years a measure admitting the Jews to parliament, which passed in 1858 upon a compromise suggested by the earl of Lucan. But the question with which he has ever been identified in the public mind is parliamentary reform. He brought in a reform bill in 1852, a second in 1854; moved the resolution which procured the condemnation of the Derby reform bill in 1859; and in 1860 brought in another government bill, which failed to pass. In 1861 he was called to the upper house, and exchanged the courtesy title of "lord John," by which he had been so long known, for that of earl Russell. On the death of lord Palmerston in 1865, earl Russell became prime minister for the second time. In 1866 he and Mr. Gladstone introduced a reform bill, which was rejected, and the ministry shortly thereafter resigned. Thenceforward, till near the time of his death, May 28, 1878, earl Russell remained an active but unofficial member of the liberal party in the house of lords. Though his voice was weak and his delivery affected, earl Russell was an admirable and successful debater; and his speeches sometimes rose to a high order of

oratory. His indomitable self-reliance and tenacity of self-assertion were sarcastically painted by the rev. Sydney Smith, who called him the "Lycurgus of the lower house." Since the works mentioned above, earl Russell published his *Recollections and Suggestions* (1875), besides selections from his speeches and dispatches, and various addresses; and, in 1873, the veteran statesman entered fearlessly on a new field, and gave us his *Essays on the Rise and Progress of the Christian Religion in the West of Europe*.

RUSSELL, JOHN SCOTT, b. Scotland, 1808; educated at the universities of Edinburgh, St. Andrews, and Glasgow. He studied engineering and became a practical ship-builder. Studying the laws of the resistance of water to floating bodies, he showed the existence of the so-called "wave of translation," upon which his "wave system" of ship-building is based. His claim to this discovery was disputed by the late Thomas Assheton Smith. Russell has built several vessels on this system, of which the *Great Eastern* is the best known. Among his more recent works are the great dome at Vienna, with a span of 360 ft. clear diameter, and his plan for carrying railway trains over sea in ships.

RUSSELL, WILLIAM, 1798-1873; b. Scotland; educated at the university of Glasgow; emigrated to America in 1817; was a teacher in Savannah, Ga., and in New Haven, Conn.; instructed classes in elocution in Andover, Cambridge, and Boston; edited the *American Journal of Education* 1826-29. Removing to Germantown, Penn., he taught a school for young ladies, and afterward had charge of similar institutions in Philadelphia, Andover, and Boston. In 1840 he established an institution for teachers in New Haven, which he removed to Lancaster, Mass., in 1853, where he long remained as director of the normal institute. He published many treatises on education, and textbooks for schools, especially in reading and elocution.

RUSSELL, WILLIAM HOWARD, LL.D., b. Ireland, 1821; educated at a private school in Dublin until 1838, when he entered Trinity college. He wrote for the London *Times* in 1841, and with such appreciation as to be attached to the parliamentary corps of that paper in 1843. He studied at the bar, entering the Middle temple in 1846, in which year he married. His first important expedition as a correspondent was in 1854, when he was sent by the *Times* to the seat of the Crimean war, in the description of which he established a high reputation for brilliancy of diction and graphic representation. He visited Moscow in 1856, and described in the columns of the *Times* the coronation of the emperor. In 1856 he was sent to India on the occasion of the mutiny, and was with lord Clyde from the capture of Lucknow until the close of the mutiny, serving in Rohilkund, Oude, etc., for which he received the war medal with Lucknow clasp. In 1858 he returned to England and established the *Army and Navy Gazette*, of which he continues editor and principal proprietor. In 1861 he was re-engaged by the *Times* as war-correspondent, and visited the United States in that capacity, but remained only until after the first battle of Bull Run. His account of that engagement rendered him obnoxious to the union leaders, and, being refused permission to accompany the army, his mission ended, and he returned to England. In 1866 he was present at the battles of Koniggrätz and Sadowa; and in 1870 at the battle of Sedan and the siege and fall of Paris. He chronicled for the *Times* the incidents of the visit of the prince of Wales to India, was a juror at the Paris exposition of 1878, and was nominated an officer of the legion of honor. He has been presented with the iron cross of Prussia, the war medal for 1870-71, the Turkish war medal for the Crimea, the order of the Medjidie (4th class), and other decorations; and in 1856 received the degree of LL.D. from the university of Dublin. He published *Letters from the Crimea*; *Diary in India*; *My Diary North and South*; and other works.

RUSSIA, EMPIRE OF, extending over a large proportion of the northern regions of the globe, includes the eastern part of Europe, the whole of northern Asia, and a part of central Asia. Lat. 38° 30' to 78° n.; long. 17° 19' e. to 190° e. (170° west). The portion of North America which formerly belonged to Russia was ceded to the United States in 1867. Russia is bounded on the n. by the Arctic ocean; on the e. by the Pacific ocean; on the s. by the Chinese empire, Turkestan, Caspian sea, Persia, Asiatic Turkey, and the Black sea; and on the w. by Roumania, Austria, Prussia, the Baltic, and Sweden. The area of Russia amounts to more than 8,000,000 sq. m., and is more than double the entire area of Europe. The empire thus covers nearly $\frac{1}{4}$ of the surface of the globe, and more than $\frac{1}{5}$ of the land superficies of the planet. The population of this vast area was in 1870 estimated to amount to upward of 86,000,000. The following table does not take account of the territories acquired by Russia in 1878, Roumanian Bessarabia, and part of Turkish Armenia:

Name of Government.	Area in Eng. square miles.	Population in 1870.
1. Archangel.....	286,595	281,112
2. Astrakhan.....	84,969	601,514
3. Bessarabia.....	14,206	1,078,932
4. Courland.....	10,550	619,154
5. Don Army, Province of the.....	61,900	1,086,264
6. Ekaterinoslav.....	26,128	1,352,200
7. Esthonia.....	7,607	323,961
8. Grodno.....	14,952	1,008,521
9. Jaroslavl.....	13,751	1,000,748
10. Kalnga.....	11,870	996,252
11. Kazan.....	23,714	1,704,624
12. Kharkov.....	21,004	1,698,015
13. Kherson.....	27,455	1,596,809
14. Kiev.....	19,671	2,175,132
15. Kostroma.....	30,796	1,176,097
16. Kovno.....	15,679	1,156,041
17. Kursk.....	18,891	1,954,807
18. Livonia.....	17,793	1,000,876
19. Minsk.....	35,277	1,182,230
20. Mohilev.....	18,535	947,628
21. Moscow.....	12,847	1,772,624
22. Nijni-Novgorod.....	19,620	1,271,564
23. Novgorod.....	46,288	1,011,445
24. Olonetz.....	50,470	296,392
25. Orel.....	18,024	1,596,881
26. Orenburg.....	73,947	900,547
27. Penza.....	15,127	1,173,186
28. Perm.....	128,151	2,198,666
29. Podolsk.....	16,233	1,933,188
30. Poltava.....	19,225	2,102,614
31. Pskov.....	16,851	775,701
32. Riasan.....	16,240	1,477,433
33. St. Petersburg.....	17,056	1,325,471
34. Samara.....	64,953	1,837,081
35. Saratov.....	32,596	1,751,268
36. Simbirsk.....	19,063	1,205,881
37. Smolensk.....	21,536	1,140,015
38. Tambov.....	25,514	2,150,971
39. Taurida.....	23,596	701,997
40. Tchernigov.....	20,238	1,659,600

Siberia.....	4,715,630	3,405,084
Central Asia.....	1,320,765	4,650,213
Russian Empire.....	8,264,200	86,586,000

The Russian Sea-board.—The northern shores of the Russian territories, which are washed by the Arctic ocean, are deeply indented. The White sea (q.v.), an immense arm of the Arctic ocean, penetrates 350 miles into the main-land, and is subdivided into the gulfs of Onega and Archangel or Dwina. The other chief inlets on the n. of Russia are the Kara Sea and the gulfs of Obi and Yenisei. Westward from Nova Zemla (usually, but less correctly, spelled Zembla), the Arctic ocean is navigable for three months of the year; e. from that island, the sea, even at the mildest season, is encumbered with floating icebergs. The chief islands in this ocean are the Kolguef, Waigatz, Nova Zemla, and Spitzbergen isles. The eastern shores of Russia are washed by the Pacific, subdivided into the Behring, Okhotsk, and Japan seas; and the islands belonging to this country in these seas are Sakhalin, and the northern part of the Kuriles. On the s. are the Black sea (q.v.), and the sea of Azov (q.v.), the latter communicating with the former by the strait of Kerteh, and so shallow that it is navigable for small craft only. Of the Caspian sea, Russia commands the whole, with the exception of the

s. shore, which belongs to Persia. The northern and eastern banks of the Caspian are the seats of the chief fisheries of the empire. On the n.w. of Russia is the Baltic sea, with the gulfs of Riga, Finland, and Bothnia; and in these waters the islands of Aland, Esel, and Dago belong to the empire. The freezing of the water near the shores of the Baltic renders the navigation of this sea impracticable during five months of the year, although a few ports are accessible throughout the whole year. Possessing means of easy communication with the most fertile governments of the interior, and sustaining chiefly the commerce of the Russian empire with the other parts of Europe and with America, the Baltic is of the highest commercial importance.

Surface, Hydrography, and Soil.—European Russia consists of a vast plain bordered with mountains. On the e. are the Ural mountains (q.v.), forming a broad range of no great elevation, ending on the n. on the shores of the Arctic ocean, and on the s. in a range of elevated plains on the left bank of the Volga. On the s.e. of the great plain is the lofty range of the Caucasus (q.v.), crossed by the pass of Derbend and the so-called military Georgian road. The Crimean mountains, a continuation of the Caucasian chain, rise to 5,000 ft. in their highest summit. The districts in the s.w. of Russia, between the Vistula and the Pruthi, are covered by hilly ranges from the Carpathian mountains (q.v.) which in Poland are known as the Sandomir mountains. The Finland mountains, on the n.w. are ranges of granite rocks, embracing numerous lakes, and not rising higher than 600 feet. The Alaunsky table-land, which connects itself with the Ural mountains by a chain of hills in lat. about 62° n., is the key to the configuration of European Russia. From this table-land, with an elevation of about 1200 ft., the country, with gradually declining slopes, falls away in four directions—n. to the Arctic, n.w. to the Baltic, s. to the Black, and s.e. to the Caspian seas. The sloping country on the n. of the Alaunsky heights is called, from its eastern and western limits, the Ural-Baltic table-land; that on the s. of the same dividing heights is called, for the same reason, the Ural-Carpathian table-land. The Alaunsky heights form the great water-shed, and regulate the course of all the great rivers of the Russian empire. To the n. they throw off the Petchora, the northern Dwina, and the Onega; to the s., the Dniester, Bug, Dnieper, Don, and Kouban; to the s.e., the Volga, with its great affluents the Oka and Kama. The western Dwina, the Niemen, and the Vistula fall into the Baltic sea. The important rivers of Russia receive separate notice under their own names. At the foot of the n.w. slope from the central terrace is the lake-country of European Russia, and the great lakes (which are noticed separately) are Ladoga, Onega, Ilmen, Peipus, and Pskov. The plain of European Russia naturally divides itself into three tracts or zones, each of which differs from the others in the nature and quality of its soil. The northern zone extends between the Arctic ocean and the Ural-Baltic table-land, the middle zone between the Ural-Baltic and the Ural-Carpathian table-lands, and the southern zone between the Ural-Carpathian table-land and the Black and Caspian seas. The soil of the northern zone is marshy, and the climate inclement. In its middle part, between the rivers Onega and Mezen, and especially along the banks of the northern Dwina, forests of fir-wood and large tracts of fodder-grass occur. Toward the e. of this tract the woods disappear, and vast marshes, frozen the greater part of the year, cover the country. The middle zone reaches s.w. to the government of Volhynia and the s. of Poland, and n.e. to the Ural mountains. In the w. it consists of an extensive hollow, covered with woods and with marshes, the chief of which are those of Pinsk (q.v.). In the middle part of this zone the soil is partly heavy and covered with mold, and toward the n., sandy. Beyond the Oka, luxuriant meadows abound; and on the e., beyond the Volga, this tract forms an extensive valley, covered with a thick layer of mold, abounding in woods, and rising into hills in the vicinity of the Ural range. The southern zone consists of steppes extending along the shores of the Black and Caspian seas. The steppes of the Black sea have mostly a moldy soil, covered with grass; but in the s.e., shifting sands and salt marshes predominate. The steppes of the Caspian consist of sand, salt marshes, and salt lakes—the Elton lake, yielding nearly 4,000,000 puds (about 1,290,000 hundred-weights) of salt annually, being the most remarkable.

Constitution and Administration.—The government is an unlimited monarchy, the head of which is the emperor, who unites in himself every authority and power—that is to say, is the head of the military, the legislative, and the judicial systems, and is also the ecclesiastical chief of the orthodox Greek church. The order of succession is by primogeniture, hereditary in heirs-male, and in females in default of males. The expenses of the imperial house amount to about £1,500,000 annually; the private property of the imperial family, yielding about £1,000,000 annually, is excluded from the budget. Every military or civil officer of the crown is required to take an oath of allegiance. The council of state is the highest branch of the executive, and comprehends the legislative, judicial, and administrative powers. The president and members—among whom are always included the ministers of the crown—are appointed by the emperor. A secretary of state, whose duty it is to report the opinion of the council to the emperor, is attached to this body. The estimates of expenditure and income, and every proposition introducing an addition to, or a modification of, the laws, is considered and revised by this council, which for the more orderly discharge of its functions, is divided into three sections: 1. Law; 2. Civil and ecclesiastical; 3. Economy and finance. The

main function of the council is that of superintending the general administration, of watching over the execution of the laws of the realm, and of proposing alterations of the same when necessary. The second of the great boards of government is the senate, whose functions are partly deliberative and partly executive. It is the high court of justice for the empire, controlling all the inferior tribunals; and besides its legal duties, it examines into the state of the public revenue and expenditure. The senate is divided into seven committees or departments, of which five sit at St. Petersburg and two at Moscow. The third college is the holy synod, superintending the religious affairs of the empire. Its decisions have no force till approved by the emperor. The fourth great board of government is the committee of ministers, the highest administrative body. It is divided into nine departments, which have under their management the court; foreign affairs; war; the navy; the interior; public instruction; finances; crown domains; public works; and has besides a general board of control. All of these great boards center in the private cabinet of the emperor. Except the departments of foreign affairs and the imperial court, all these branches of the central administration are represented in the provinces. European Russia is divided into 50 provinces, over each of which is a governor, appointed by the emperor, and who is the head of the civil administration of the province or government. Some provinces, although administered by governors, are united under the superintendence of a governor-general. This arrangement is rendered necessary owing to the immense extent of the empire, and the governor-generalships are generally remote frontier regions. Of late years (especially since 1862), reforms have been effected throughout all the various branches of the government. Reforms in the municipal and rural administration of the provinces have given increase of self-government. A new legal system, including oral testimony, trial by jury, and publicity of courts, was introduced in 1864. By the Russian law, capital punishments are only inflicted for high-treason. The severest punishments inflicted for violations of the law (see KNOW) are labor in the galleys, in the public works, deportation to the mines of Siberia, etc. The audacity of the revolutionary party known as nihilists (see NIHILISM) has caused of late increased rigor and frequency of political punishment. Repeated and fatal attempts on the life of high-placed officials, and the acquittal by a jury of one of the most notable assassins, led in 1878 to the withdrawal of trials for political offenses from juries; such trials are now conducted by court-martial.

Distinctive Rank of Classes.—The nobility occupy the highest place in the social scale, enjoy many special privileges, such as freedom from poll-tax, and form in every province a separate body, headed by a marshal, chosen by and from themselves. Till 1871 they were also free from the conscription. Functionaries, officials, artists, and clergy possess almost as many privileges as the nobility. In 1868 a most important measure was passed, by which the clerical character was declared to be no longer hereditary, and the sons of the secular clergy, hitherto bound to some ecclesiastical or monastic service, were set free to choose their own career. The next class is that of the merchants. The burghers and peasants constitute the lowest class, and are subject to claims of service and to personal taxation. Each class enjoys, to a certain extent, the right of self-administration in its own affairs. Each apportions its taxes, and chooses some of its own functionaries. The recent emancipation gave freedom to 20,000,000 peasants or serfs who, prior to the year 1861, being governed exclusively by their owners, enjoyed very limited civil rights. Communal government is the fundamental principle of all the rights of the peasant class. In general, the lands allotted to the peasants are not their individual property, but belong to the commune, and are shared among all its members.

National Debt.—The national debt must be regarded as divided into two parts, one of which represents the loans made abroad, and the other the loans made at home. Its total amount was given in 1878 at £350,000,000, about half of which was contracted abroad. Several recent loans have been raised in order to tide over the terrible financial stress produced by the late war with Turkey, the expenditure for which has been officially stated (greatly understated, it is believed) at £130,000,000.

Revenue and Expenditure.—The following table shows the amount and the details of the revenue and expenditure for the year 1872:

REVENUE.

1. Direct taxes (including Poll-tax)	£14,887,697
2. Indirect taxes (including those derived from spirits, salt, tobacco, beet-sugar, customs, and stamps)	34,118,422
3. State monopolies (drawn from mines, money, post-office, telegraphs)	2,957,611
4. State domains	5,458,083
5. Miscellaneous receipts	6,327,174
6. Revenue of the trans-Caucasus	750,782
7. " Recettes d'ordre"	2,690,842
8. Extraordinary receipts	948,674
Total	£68,139,285

EXPENDITURE.

1. Public debt.....	£11,833,092
2. Superior institutions of the state.....	244,842
3. Holy synod.....	1,288,483
4. Ministry of the imperial household.....	1,226,531
5. " foreign affairs.....	343,226
6. " war.....	21,452,618
7. " marine.....	2,845,105
8. " finances.....	10,623,946
9. " imperial domains.....	1,313,404
10. " interior.....	5,821,457
11. " public instruction.....	1,541,363
12. " public works.....	3,072,153
13. " justice.....	1,449,859
14. Audit of the empire.....	274,063
15. General direction of studs.....	94,880
16. Expense of Poland for administration of justice.....	111,222
17. Civil government of the trans-caucasus.....	769,955
18. "Non valeurs".....	136,986
19. "Dépenses d'ordre".....	2,664,150
20. Extraordinary expenses.....	948,674
Total.....	£68,053,509

The total revenue for 1876 was over £76,900,000, and the expenditure £78,775,000, leaving a deficit of more than £1,800,000.

Army.—Although a small permanent force was in existence from very early times, a standing army was first instituted in Russia toward the close of the 17th c. by Peter the great. Before that time, military levies were raised for longer or shorter periods, to suit the exigencies of the moment. Till lately the army was raised by conscription under an imperial ukase; but in 1870 an imperial ukase announced the principle of universal liability to military service, and another in 1874 reorganized the entire military system. There is an annual conscription to which all men who have completed their 21st year, and are not physically incapacitated, are liable. Substitution is prohibited. The period of service in the army is 15 years, six in active service, and nine in the army of reserve. During the latter period, the soldier is liable to service only in time of war. To enable the educated classes to free themselves from compulsory conscription, young men sufficiently educated may enter on a short period of service from their 17th year. On Jan. 1, 1863, the standing army, including the guard, consisted of 31,110 generals, staff, and commissioned officers, and 818,105 privates and non-commissioned officers. This force was divided into 608 battalions of infantry, 313 squadrons of cavalry, and 182 batteries of artillery. Besides this establishment, there were 300,000 irregular troops, consisting of Cossacks, Kirghiz, Circassians, and other contingents, who are liable to military service in lieu of paying taxes. The law of 1874 thoroughly remodeled the whole military organization of the Cossacks, who now form in time of peace a perfectly organized body of men, easily attached to the cavalry division in time of war. In peace they have 21 regiments and 8 horse-batteries, increased in war to 62 and 22 respectively. The grand-duchy of Finland has a military system of its own. The Russian army, on the peace footing, consisted, in 1879, of about 770,000 men, of whom about 470,000 belonged to the regular army, and 300,000 to the reserve. In time of war the number can be raised to 1,500,000. (For further details see *ARMIES, MODERN.*) The expenditure for the army, as set down in the estimates for 1876, was £25,752,430.

Navy.—The Russian boundaries were first advanced to the sea under Peter the great, and from the genius of that monarch the Russian navy sprang. Besides the naval depôts on the Baltic, the Black, and the Caspian seas, there are also naval establishments on the shores of the North Pacific and on the Amur. In 1875 Russia had 137 war-vessels in the Baltic sea, 31 in the Black sea, and 55 on other waters. In all, there were 223 ships with an aggregate burden of 190,000 tons, 29 being iron-clads. The expenditure for the navy was in 1876 estimated at £3,576,900.

Religion and Churches.—Toleration of all religions which do not violate public morality or good order, exists in Russia, and not to profess the orthodox Greek faith, the national religion, does not disqualify for the enjoyment of any civil rights. The law does not allow those who already belong to the established faith to secede from it; and if, in a household, either of the parents be a member of the Greek church, all the children must be brought up within that communion. The emperor is head of the church, the affairs of which he directs by means of a synod composed of the chief prelates, who are summoned from their dioceses to attend its meetings (see *RUSSIAN CHURCH*). The direction and regulation of all other religious communities emanates from a department in the offices of the minister of the interior. In 1871 there were in European Russia, exclusive of Finland and Poland, 53,139,247 orthodox Greeks; 922,079 Raskolniks; 37,136 Gregorian Armenians; 2,882,991 Roman Catholics; 2,234,112 Protestants; 1,829,100 Jews;

2,358,766 Mohammedans; and 255,503 heathens. In 1861 there were 614 orthodox convents, 137 of which were occupied by women. There were 5,648 monks, and 4,879 lay-brothers; 2,931 nuns, and 7,669 lay-sisters; 50,394 priests and deacons, and 63,421 other persons, who were employed in religious services in the 50,165 orthodox churches. For the education of the clergy, there are 4 academies, 50 seminaries, and 201 schools, in which 54,000 persons are trained. The churches, convents, and the ecclesiastical departments in general, are maintained by government.

Public Instruction.—The department of public instruction in Russia is presided over by a ministry, although many of the schools are directed by other departments. The greater number of these establishments are supported out of the imperial treasury. Russia in Europe, excepting Finland, is divided into nine educational districts—namely, St. Petersburg, Moscow, Dorpat, Kiev, Kharkov, Kazan, Odessa, Wilna, and Warsaw—each, Wilna accepted, having a university. Of the students—who do not reside within the universities—the poorest are allowed stipends for their maintenance, and the candidates for admission as students must have passed satisfactory examinations in the courses of instruction gone through at the gymnasia. Degrees are conferred in law, medicine, philology, mathematics, natural history, and the oriental languages. Degrees in theology are granted at Dorpat to students of the Lutheran faith. The professors are appointed and paid by the government. Four institutions, the law school and lycées of St. Petersburg, Nijni, and Jaroslav, are specially devoted to legal science. The gymnasia, schools of the second class, about 130 in number, are found in the provincial towns. Besides the universities and gymnasia, there are numerous district schools; but the means of instruction, though rapidly increasing, are very insufficient. In 1853 there were only 3,000 village schools; in 1863 the number had enormously increased. There are also numerous special schools for instruction in mining, in wood-craft, civil engineering, navigation, etc. The military schools form a separate system. The cadets are transferred from the military gymnasia to the "military schools," in which they qualify to fill the posts of commissioned officers. Three academies, for the staff, the engineers, and the artillery, are devoted to the higher branches of military science. Theological education for the orthodox church is superintended by the clergy. According to the report of the minister of public instruction, there were in 1875, in the nine educational districts, 20,376 primary schools, attended by 670,186 boys and 169,379 girls.

Literary and Scientific Institutions, Museums, Press, etc.—Many of the most important institutions in Russia, as the academy of sciences and the Pulkova observatory, flourish in or near St. Petersburg (q. v.). There are, however, throughout the empire numerous institutions and societies for the promotion of the arts and sciences. The imperial library at St. Petersburg, with upward of a million volumes, is one of the finest in the world. The press of Russia, not yet much developed, is subject to special censorship, which, though rigorously exercised under the reign of Nicholas I., is now, under the milder government of Alexander II., considerably less strict. Each year gives evident proof of the rapidly increasing taste for literature and mental culture in Russia. In 1863 there were published within Russia and in the Russian tongue 1652 volumes. In the years 1873 and 1874, 5,206 books were published in Russia, of which 447 were translations from other languages.

Charitable Institutions are for the most part supported by government; and although their number is increasing annually, the scarcity of large national institutions—especially public hospitals—is painfully felt. Medical assistance can only be obtained in the provinces with the greatest difficulty, owing to the distances of the towns and the sparseness of the population. The foundling hospitals of St. Petersburg and Moscow receive annually about 15,000 abandoned infants and orphans.

Public Roads, Railways, and Canals.—Good roads and ready means of communication are a great want in Russia, where the distances are so great, and the population so scanty. To keep the roads in repair is a work of the greatest difficulty here, for two reasons—the first, a difficulty in concentrating a sufficient amount of labor where the laborers are so few and so widely dispersed; and the other, the melting of the snows and overflowing of the rivers in spring. During four or five months of the year the soil is thickly covered with snow, which, when it becomes hardened by the frost, offers an excellent, an easy, and a universal means of transit. On the return of mild weather, however, the snow melting, sinks into and softens the earth, which is also overflowed by the rivers. The roads being thus flooded are rendered almost wholly impassable for traffic till the soil dries. In autumn the usual rains fall, and the earth is again soaked, so that the time for easy communication during the summer is very short. In 1856 only 784 m. of railway had been opened, though a large extent was being constructed; but in Jan., 1877, the mileage in operation had risen to 13,000, while upward of 1300 m. were being constructed. Several of the chief cities of the empire are connected by means of macadamized causeways, which are now generally kept in good repair. The other towns are connected by ordinary track-roads, which are generally impracticable in spring and autumn. Owing to the generally bad character of the surface, and to the abundance of the rivers which traverse it, the water-communications of this empire are very important as commercial highways, though the vast transit-trade of the country is not confined to them alone. The transport of merchandise across the broad expanse of the empire is much facilitated by canals, which have here become an important and a pecul-

far institution. The four seas surrounding European Russia are connected by canals: 1. The Caspian is connected with the White sea by the canal of the Prince of Wirtemberg, between the river Schekсна, an affluent of the Volga, and the upper waters of the northern Dwina. 2. The Caspian and Baltic are connected by three systems of canals. See VOLGA. 3. The Black sea is connected with the Baltic by three lines of canals—those of Beresina, Oginsky and Dnieper, and Bug, between the affluents of the Dnieper and those of the western Dwina, Niemen and Vistula.

Postal Service.—This service was inaugurated in 1664. In 1875 there were forwarded 63,244,156 letters, 1,419,094 post-cards, 42,776,220 newspapers and stamped periodicals, and other packets, amounting in all to 121,517,735. The number of offices was 3,678 in 1877.

Electric Telegraph.—Notwithstanding the immense extent of the surface of Russia, and the distance from each other of its principal towns, these are now nearly all united by lines of electric telegraph. In Jan., 1875, upward of 40,000 m. of telegraphs had been laid by the Russian government, and 13,000 m. by private companies. In the end of Nov., 1871, the telegraph line through Siberia, connecting St. Petersburg with China and Japan, was finished, and a telegram forwarded from Nagasaki to the Russian capital. In 1874 there were sent 2,920,071 telegraphic messages to places within Russia, 365,000 to places abroad, and 209,194 official dispatches.

Population.—The population of the empire is spread with great irregularity over the surface. In European Russia its average is less than 37 per Eng. sq.m.; in the Caucasus, more than 28; in Siberia, $\frac{1}{2}$; in Poland, 112; and in Finland, 14 per Eng. sq. mile. These figures, however, cannot be taken as a correct illustration of the actual distribution of the masses over the enormous surface of the country; for, upon comparison, the degree of the density of the population of European Russia is found to vary greatly in the different governments. The government of Moscow contains 166 inhabitants per Eng. sq.m.; while that of Archangel contains only $\frac{1}{4}$. The central and s.w. governments of this part of the empire are the most densely peopled. The town residents are $9\frac{1}{2}$ per cent of the whole population of European Russia; $7\frac{1}{2}$ per cent of that of the Caucasus; and 5 per cent of that of Siberia. Russian society is divided into five classes, and of these the nobility forms 1.49 per cent; the clergy (including their families) 1.01 per cent; the burghesses (*tiers état*) 8.60, the peasants, 82.55; and the military, 6.35 per cent. Irrespective of Asiatic and American Russia, we find that in Europe this empire comprises a greater variety of races than any other European state. It is not, however, like Austria, a composite community, speaking various idioms, and having different physical characteristics and political interests. In European Russia the predominant race is the Slavonian, and the Russian "element" and language prevail almost universally. The 50,500,000 Russians who inhabit Europe are divisible into—1. Great Russians (33,935,000), inhabiting central Russia. 2. Little Russians (12,015,000), located in the s.w. To the latter may be added the Cossacks (1,600,000), who are spread along the rivers Don, Kouban, Terek, Ural, Tobol, the lake of Baikal, and the Amur. 3. White Russians (2,950,000), in the western provinces. The other Slavonic races are Poles (4,640,000), in the kingdom of Poland, and partly in the w. provinces (where they form only $10\frac{1}{2}$ per cent of the population); Servians and Bulgarians in Bessarabia and New Russia. The Finnish race (3,800,000), which occupies, under different names, the n. and n.e. of European Russia, and the n.w. of Siberia, has in great part adopted Russian language and manners. The Lithuanians and Letts (2,460,000) dwell mostly between the Niemen and Dwina. The Turkish Tartarian race (5,700,000), in the s.e., and partly in Siberia, comprises Tchuvashes, Tartars of Kazan, Kirghiz, etc. The Mongols (376,000), comprising Kalmaucks and other races in the s.e. of European Russia and in the e. of Siberia. Besides these races there are Romans and Wallachs (770,000), in Bessarabia and New Russia; Persians, Kurds, Armenians, etc. (460,000), near the Caspian sea; Germans (920,000), distributed over the whole empire, but found in the greatest numbers in the Baltic provinces; Swedes (200,000), in Finland; Greeks (52,000), in the s.; Bohemians—i.e., Gypsies (50,000)—chiefly in Bessarabia; Jews (2,014,000), mostly in Poland and the w. provinces; Caucasians (1,820,000), Samoieds in the n. of Russia, and many other tribes in e. Siberia and Russian America.

Climate.—Owing to its vast extent, the Russian empire presents great varieties of climate. At Archangel the mean temperature of the year is 32° Fahr.; at Yalta, in the Crimea, 52° ; and at Kutais, in the Caucasus, 58° . Consisting of an immense area of dry land, the climate of the empire is essentially continental; and the climate of localities in its interior is much more rigorous than that of places on the western shores of Europe in the same latitude. The mean temperature of Edinburgh and Christiana is higher than that of Moscow and Kazan. The rigor of the climate of the empire increases not only with the latitude, but as you advance eastward; thus, the mean winter temperature of the town of Abo, on the gulf of Bothnia, is the same as that of Astrakhan—viz., 23° Fahr.; although the former is in lat. 61° , and the other in lat. 47° , or 14° nearer the equator. The difference of the mean summer temperature under the same latitude is, on the contrary, not very considerable. The isothermal line of Astrakhan (60° Fahr.) passes through Lublin in Poland and Ekaterinoslav. In the e. the maximum heat is even greater than in the w.; and such heat-loving plants as the watermelon are grown more successfully in the s.e. of Russia than in the w. of Europe, under the same latitude.

The dryness of the atmosphere increases in the direction from n.w. to s.e. On the banks of the Baltic the average number of rainy and snowy days is 150, and the annual rainfall is 20 in., while near the Caspian the number of such days is 70, and the rainfall only 4 inches. The climate of Russia is in general healthy; but there are several places where diseases seem to be localized, as the shores of the Frozen ocean, where scurvy is common, the marshes along the Niemen and Vistula, where the *plica polonica* (q.v.) is the chief disease, and the marshy lands on the Black, Azof, and Caspian seas, where ague always prevails.

Manufactures.—Manufacturing industry in Russia may be said to date from the reign of Peter the great. With a view to its promotion, foreign manufactured goods are heavily taxed on importation. In 1870 the number of factories (exclusive of iron-works and all establishments engaged in the preparation of metals) was 19,431, which employed 410,235 hands, and produced articles amounting to 373,000,000 rubles. Of these factories, a half were in the governments of St. Petersburg, Moscow, and Vladimir. The metallurgical works are mostly in the government of Perm, and in other eastern governments bordering on the Ural mountains. Small handicraft manufacturing establishments abound in all the central governments, especially in the neighborhood of Moscow, where whole villages during the winter season are employed in some special industry, as weaving, tanning, fur-dressing, joiners' work, shoemaking, etc. The chief manufacture is spinning and weaving flax and hemp. Linen is manufactured to the value of 100,000,000 rubles, chiefly in hand-loom; although the finer qualities are manufactured by power-loom, mostly in the government of Jaroslav and Kostroma, and the capitals. Hemp is manufactured into sail-cloth and ropes, which articles are largely exported. Woolen and worsted stuffs are made to the value of 50,000,000 rubles, and the quantity is on the increase. Fine cloths and mixed fabrics are made in the capitals, and in the governments of Livonia and Tchernigov. Silk-spinning and weaving are carried on in the factories of Moscow, which is renowned for its brocades, and gold and silver embroideries. Through the influence of the protective system, cotton spinning and weaving have been of late very rapidly extended. In 1860 there were 158 cotton spinning mills, producing goods to the value of 53,350,000 rubles; and weaving establishments to the value of 13,000,000 rubles. After weaving, the next most important branch of industry is tanning, the products of which amount to 20,000,000 rubles. The other important branches of industry are cutlery, made in the town of Tula, the Russian Sheffield, and in the governments of Nijni-Novgorod, Vladimir, and Kostroma; and pottery and glass works, the former carried on in the government of Moscow, the latter in that of Vladimir. The produce of the machine factories in 1870 did not exceed 15,000,000 rubles; of the sugar refineries, 27,250,000 rubles; of the paper-mills, 5,750,000 rubles.

Commerce.—The Russian empire, including provinces varying widely in their natural and industrial resources, presents an extensive field for internal commerce, while the abundance of its products maintains a vast foreign trade. Of the former, which is by far the more important, the extent and value cannot be given, owing to the want of statistical data. Moscow, in the center of the industrial provinces of the empire, and the great depot for the wares that supply the trades of the interior, is the chief seat of the home-trade. The other large trading towns are chiefly those on the banks of the great rivers. The goods yearly conveyed by the Volga alone amount 200,000,000 rubles. Owing to the distances between the great trading towns, fairs are still of great importance in Russia. The transactions of all the fairs in the empire amount to more than 300,000,000 rubles, and the chief are those of Nijni-Novgorod (q.v.), Irbit (q.v.), Kharkov (q.v.), Poltava (q.v.), and Kursk (q.v.).—The foreign trade consists mainly of the export of raw products, and the imports of colonial and manufactured goods. The foreign trade by sea is five times greater than the trade by land; and of the latter, the commercial transactions with Europe amount in value to ten times the Asiatic trade. One-third of the whole foreign commerce is transacted at St. Petersburg, one-ninth at Odessa, and one-fifteenth at Riga. In 1875 the number of vessels that entered the ports of Russia were 13,527, and of these 2,475 were Russian, 2,339 English, 1652 German, 1471 Swedish and Norwegian, 762 Italian, 684 Dutch, and 1896 Turkish, etc. The following table gives the value of the chief articles of export for the years 1870 and 1871:

	EXPORTS.	
	1870.	1871.
	In Thousands of Rubles.	
Cereals.....	162,990	182,948
Flax.....	57,098	49,583
Linseed.....	27,142	28,743
Hemp.....	11,005	12,334
Tow.....	2,827	2,324
Tallow.....	6,650	4,660
Wool.....	7,868	7,626
Cattle.....	7,217	6,358
Bristles.....	8,611	9,861
Hides.....	2,266	1,833
Wood.....	13,146	14,026
Oil seeds.....	1,566	3,420

The chief articles of import are sugar, tea, and coffee, cotton, cotton-yarn, raw silk, iron, (cast and wrought), wine and other liquors, dyes, fruit and vegetables, machinery; cotton, silk, woolen, and linen stuffs. The total exports amounted in value in 1861 to 163,721,683 rubles; in 1875, to 381,592,000 rubles. The imports were in 1861 valued at 144,971,791; in 1875, at 531,056,000. So that during these fifteen years the trade of Russia with foreign countries has increased to about threefold. The Russian exports to England are greater than those to any other foreign country; while Russia imports most extensively from Germany. In 1875 imports from Germany amounted to 221,442,000 rubles; from England, to 133,704,000. The commercial marine of Russia is at yet not much developed. At the end of 1874 it comprised 2,512 sea-going vessels, of an aggregate burden of 260,504 lasts, or 521,008 tons, besides 385 trading steamers on rivers and lakes.

Geology and Mineral Products.—A more intimate knowledge of the geological structure of Russia may be said to date from 1841, when the eminent geologist, sir R. I. Murchison, undertook a scientific journey to Russia and the Ural mountains. His geological investigations, together with the paleontological researches of his colleagues, E. de Verneuil and count Kayserling, have served as a basis for further surveys. The oldest stratified rocks are the Silurian, on the southern shores of the gulf of Finland, sinking down below the Devonian strata, which run in two large branches—on the s.e. to Voronezh, and on the n.w. to Archangel, both overlaid to the e. by a still more extensive deposit of carboniferous rocks. The immense triangle between those layers and the Ural is occupied by the Permian system (except the n.e. extremity, which is covered by Jurassic beds), named by sir R. I. Murchison from its development in the government of Perm. To the s. of the s.e. Devonian branch extend deposits of the cretaceous period, and detached patches of the carboniferous formation. The latter contains, in Russia, only the older members of the group up to the mountain limestone, which contains numerous but thin seams of coal, generally poor in quality. The field along the Donetz forms an exception, and yields annually about 96,400 tons ($\frac{1}{2}$ of the total quantity raised in Russia) of good coal and anthracite. The remaining s.w. and s.e. parts of the empire are covered by tertiary beds, more or less recent. The Ural mountains present an outcrop of all the secondary and paleozoic formations down to the stratified gneiss and granite, which latter composes nearly the whole province of Finland, and skirts the middle course of the Dnieper. The Ural mountains (q.v.), which contain almost all the mineral riches of the country, are the principal seat of mining and metallurgic industry. They produce gold, platinum, copper, and iron of excellent quality, especially the last, which is manufactured from magnetic ore. Emeralds and jaspers, etc., are also found, as well as diamonds of an inferior quality. Gold, silver, copper, plumbago, etc., are also obtained from the Altai and Nerchinsk mines in Siberia (q.v.). In 1863 the whole produce of the mines amounted to £12,000,000; and of this large amount the chief items were pure gold, 1460 puds (pud = 40 Russian pounds = 36 lbs. avoird.); silver, 968 puds; platinum, 31 puds; copper, 294,169 puds; lead, 150,000 puds; cast-iron, 18,404,500 puds—out of which were manufactured 11,998,500 puds of wrought-iron, and 145,000 puds of steel. Salt was obtained to the value of 14,000,000 rubles, chiefly from salt lakes in Bessarabia and the Crimea, from lake Elton in Astrakhan, and from the inexhaustible layers of rock-salt near Iletzk (q.v.). The total produce of coal from all the Russian mines in 1874 amounted to 83,575,000 puds. Excellent china-clay or kaolin is found near Gluchov, in the government of Tchernigov.

Agriculture and Products.—Russia is an eminently agricultural country, although only a comparatively small portion (271,000,000 acres) is under cultivation. In the central zone (see above, under *Surface*), the soil is almost entirely black mold, extremely fertile, and hardly ever requiring manure. The system of husbandry most extensively practiced is what is called the "three-field system," in the working of which, one-third of the land is always in fallow. In the s. and s.e., a system of agriculture peculiar to Russia is in operation: it is called the "fallow system," and consists in raising three or four consecutive crops from the same land, and afterward allowing it to lie fallow for five or six years, after which time it begins to grow feather-grass (*stipa pennata*), which is considered a token of returning fertility. Husbandry, in general, has undergone great changes since the emancipation of the serfs, to whom a considerable portion of the land has been transferred in freehold. The land-owners, deprived of their former right to the labor of their serfs, now find it more profitable to reduce the amount of their land in cultivation, or grant portions of it in lease to the peasants, often in return for the half of the produce of the crop. A great drawback to the development of agriculture is the want of proper means of communication, and consequently the low price of corn in the locality in which it is grown. Fodder-grass is rarely cultivated, as a sufficient supply of fodder is afforded by the extensive natural meadows. The chief cereals are wheat, which is grown as far n. as lat. 62°; rye, barley, and oats. Buckwheat and millet are grown in the s., and from these, but especially from rye, the staple food of the inhabitants is made. Hemp and flax are extensively cultivated; and the oil extracted from the seeds of the former is an indispensable article of the peasant's household, as it is used for food during the fasts, which, taken together, extend over about half the year. Of flax, 12,000,000 puds are annually produced; of hemp, 7,000,000 puds; and 3,000,000 puds of oil-seeds. After the famine of 1839, government introduced, and afterward did much

to promote the cultivation of potatoes. The yearly produce of this crop amounts to 35,000,000 *tchetverts* (1 *tchetvert* = 5.77 imp. bushels). Tobacco crops cover 16,000 acres, and the amount produced is 2,500,000 puds. Beet-root and maize are also cultivated; and there are numerous vineyards in the Crimea, in Bessarabia, and along the Don. Gardening is an important branch of industry, the products being cucumbers, onions, cabbages, and other vegetables and fruits. An area of 486,000,000 acres is covered with woods, but the quantity of timber, from which material the peasant supplies almost all his wants, is at present suffering diminution. The Russian builds his cottage with timber, heats his room with it, lights his house with firewood, makes his household utensils from the same material, as well as his cart, etc.; he also wears shoes, and uses mats for coverings, which are made from the inner bark of the lime-tree. In the n., the forests occupy from 90 to 95 per cent of the whole surface; in the s., they are 2 per cent less than in England. Coniferous trees are the chief in the northern districts; but in the central tracts, oaks, limes, maples, and ashes are the chief. Timber is the chief article of internal commerce, and is floated down the rivers from the well-wooded districts to those which are destitute of wood.

Animals and Animal Products.—In the northern and central provinces, cattle are kept chiefly for the purpose of obtaining manure; but in other parts, cattle-breeding is an important branch of industry. On an average, there are 30,900,000 head of cattle in Russia. Of horses, the best, chiefly trotters, are reared in breeding-stables in the southern central governments; but the great bulk of the horses are obtained from the half-wild studs of the Cossacks, Kalmucks, and Kirghiz. The horses of Viatka, Kazan, and Finland are strong and hardy. The total number of the horses in Russia is about 18,000,000. Sheep-breeding is carried on extensively on the southern steppes. The sheep number 10,000,000, of which upward of 1,000,000 are of the fine merino breed. Besides these animals, there are camels in the s. of Russia, reindeer in the n., and hogs and poultry in great abundance everywhere. A breed of the *urus* (q. v.), a huge and rare animal, which does not occur in any other country, is preserved in a forest of the government of Grodno. Among the wild animals are (chiefly in the n.), the bear, wolf, elk, fox, and marten; on the northern coasts are found the seal and walrus, and the eider-duck and other wild fowl. The more expensive kinds of furs are procured from Siberia, and from the Russian colonies in America, where the Russian-American company has the exclusive privilege of the fur trade. The most important Russian fisheries are those of the Caspian and Black seas, and the sea of Azof, and their tributaries. Herrings, cod-fish, and salmon are caught in abundance in the White sea. Bee culture is very general in Russia, and silk-worms are reared in the Caucasus.—See the statistical works of Sarauw (1873); Von Lengenefeldt (1875); Wilson (St. Petersburg, 1876); and *Russia*, by D. Mackenzie Wallace (1877).

History.—Copious histories of Russia are numerous, those of Karamsin, Solovief (1851-77); Schnitzler (German transl. 1875), being standard Russian works. More accessible are Turgenief, *La Russie* (Par. 1847); Rambaud, *Histoire de Russie* (Par. 1878).—The population of the Russian empire is composed of various nationalities, but the predominant one is the Slavonic (q. v.). The eastern Slaves, the ancestors of the Russians, were settled near the sources of the rivers Volkhof, Bug, Dniester, Dnieper, and Don, and consisted of several tribes whose chief towns were Novgorod and Kiev. Being much harassed by their warlike neighbors, and distracted by intestine dissensions, the Slaves of Novgorod and the neighboring Finnish tribes, in 862, sent ambassadors to “the Variags (Varangians, Normans) beyond the sea,” inviting their chiefs to come and reign over them. Three brothers of the tribe, called by the old chroniclers *Rurik* (q. v.), Sineous (Sindf), and Truvor, accepted the invitation, and at the head of a band of armed followers (*droujina*) took possession of the territory of Novgorod. Oleg (879-912), who exercised authority as regent to Igor, Rurik’s son, took Kiev, and made it the capital of the embryo empire, subduing the neighboring tribes, and even successfully attacking the Byzantines. Igor (912-945) did nothing of note, but his widow and successor, *Olga* (945-957), was a wise and able ruler. She was baptized in 955 by the patriarch of Constantinople, and abdicated soon after in favor of her son *Sviatoslaf* (957-972), a warlike monarch and a pagan, who was treacherously murdered by a neighboring tribe with whom he was at war. On his death, the principality was divided among his three sons, and the quarrels usual in such cases followed, and continued till *Vladimir* (980-1015), the youngest son, became sole ruler. The Normans now definitively became amalgamated with the Slavonic race. Vladimir’s reign is the “heroic” epoch of Russian history; and the glories of the court, and the valiant feats of the warriors of the “sunny prince Vladimir,” have been handed down through ages in legend and song. His successful wars extended the boundaries of Russia to lake Ilmen on the north, to the mouths of the Oka and of the Khoper (an affluent of the Don) on the east, to the falls of the Dnieper on the south, and to the sources of the Vistula on the west. He became a convert to the Greek faith, and in 988 was baptized with his followers; his example being shortly followed by the whole nation, for whose spiritual guidance and supervision a metropolitan was established at Kiev. He followed the evil example of his father in dividing his dominions, and after his death a civil war broke out among his four sons, in which *Jaroslaf*, prince of Novgorod, was ultimately (1036) successful. This prince did much to civilize his subjects by building towns, founding schools, and especially by ordering the compilation of

the first Russian code of laws (the "Rousskaia Pravda"), the most prominent item of which was the limitation of the right of family feud, a limitation which was changed into total abolition after his death in 1054, by his sons, who shared the principality among them. Each of these petty princes in turn divided his portion of territory among his sons, till the once great and united realm became an agglomeration of petty states quarreling with each other, undergoing absorption by a more powerful neighbor, or being redivided. This state of anarchy, confusion, and petty warfare dates from the death of Jaroslaf in 1054, and continued, more or less, till 1478. The principal among the subdivisions of Russia during this period were, according to Russian authorities, *Sousdal*, which occupied the upper and central parts of the basin of the Volga, and from which, in the beginning of the 13th c., sprang the principalities of *Tver*, *Rostof*, and *Vladimir*; *Tchernigof* and *Seversk*, which occupied the drainage-area of the Dessna (an affluent of the Dnieper), stretching to near the sources of the Oka; *Riazan* and *Murom*, along the Oka basin and the sources of the Don; *Polotsk*, including the basins of the western Dwina and Beresina; *Smolensk*, occupying the upper parts of the basins of the western Dwina and Dnieper; *Volhynia* and *Galicia*, the first drained by the Pripet, the second lying on the n.e. slope of the Carpathian mountains, which were united in 1198; *Novgorod*, by far the largest of all, which occupied the immense tract bounded by the gulf of Finland, the lake Peipus, the upper parts of the Volga, the White sea, and the northern Dwina; and the grand-duchy of *Kief*, which, from its being formerly the seat of the central power, exercised a sort of supremacy over the others. *Novgorod*, however, from its size and remoteness, as well as from certain privileges which had been granted to it by Jaroslaf, was almost independent of the grand-duchy. The citizens of *Novgorod* chose their own dukes, archbishops, and in general all their dignitaries, and proved the superiority of their system of self-administration by increasing in power and wealth year by year. One of the chief factories of the great Hanseatic league was established in *Novgorod* in the 13th century. In fact, so great was its fame throughout Russia, as to give rise to the proverb, "Who can resist God and the mighty *Novgorod*." The princes of these states had each his standing army, and were continually quarreling; but the people were less oppressed than would naturally be expected under such circumstances, on account of the establishment in each state of a "common council" or *veche*, which exercised an important influence in state affairs, and without which the prince was almost powerless. This period was also marked by the gradual amalgamation of the different Slavic races into one, the present Russian race, a process doubtless aided by the universal dissemination of Christianity, which assimilated their various languages, manners, and customs. The chief of the grand dukes of *Kief* was *Vladimir*, surnamed "Monomachus" (1113-25), whom chroniclers are never tired of lauding as a model prince, and one whose authority was acknowledged almost as paternal by the princes of the other provinces. In 1163 the ruler of *Vladimir* took possession of *Kief*, and proclaimed himself grand duke. In 1222 the Mongol tide of invasion had swept westward to the *Polotzes*, a nomadic tribe who ranged over the steppes between the Black sea and the Don, and whose urgent prayers for aid were promptly complied with by the Russian princes; but in a great battle, fought (1223) on the banks of the *Kalka* (a tributary of the sea of *Azof*), the Russians were totally routed. The Mongols, as usual, did not follow up their victory; but twelve years afterward, *Batû Khan*, at the head of half a million of *Kiptchak* Mongols, conquered the e. of Russia, destroying *Riazan*, *Moscow*, *Vladimir*, and other towns. The heroic resistance of prince *George of Vladimir* cost the lives of himself and his whole army on the banks of the *Siti*. The Mongol conqueror's victorious career was, however, arrested by the impenetrable forests and treacherous marshes to the s. of *Novgorod*, and he was forced to return to the Volga. In 1240 he ravaged the s.w., destroying *Tchernigof*, *Galich*, and *Kief*; ravaged *Poland* and *Hungary*, defeating the Poles at *Wahlstatt*, and the Hungarians at *Safó*; but being checked in *Moravia*, and receiving at the same time the news of the khagan's death, he retired to *Saraf* on the *Akhtuba* (a tributary of the Volga), which became the capital of the great khanate of *Kiptchak*. Thither the Russian princes repaired to swear allegiance to the khan, and take part in the humiliating ceremonies which the barbarous conqueror exacted from his tributaries. The taxes of Russia were farmed out by the khan to contractors, who were generally oriental merchants, and they were collected by the aid, when necessary, of the khan's soldiers. But in later times (during the most of the 14th and 15th centuries), when the fiery energy of the Mongols was on the decline, the taxes were collected by the Russian princes and sent to *Saraf*. The Mongol invasion had an evil influence on the political, social, and moral life of Russia; it totally destroyed the elements of self-government, which had already attained a considerable degree of development, arrested the progress of industry, literature, and the other elements of civilization, and threw the country more than 200 years behind the other states of Europe. The principalities of *Kief* and *Tchernigof* never recovered this crushing blow, and the seat of the metropolitan was removed to *Vladimir*. Their decline, however, made room for the rise of *Galich* to pre-eminence in Western Russia, and under the rule of a series of wise princes it preserved greater independence than any of the Russian principalities, till, in the latter half of the 13th c., it was taken possession of by *Kasimir III.* of *Poland*; and about the same time *Volhynia* was joined to the grand-duchy of *Lithuania*. The rise of this latter state was much favored by the

prostration to which the Russian princes were reduced by the Mongol invasion, and after a flourishing existence of several centuries, during which it extended in power, so as to include Livonia proper, and the Russian provinces of White Russia, Volhynia, Podolia, and the Ukraine, it was joined in 1569 to Poland. On the n. of Lithuania arose in the beginning of the 13th c. another power, the Livonian Knights Sword-bearers, who took possession of Livonia, Courland, and Esthonia, as well as some portions of the territory of Novgorod and Pskov. The grand-ducal title passed after the Mongol invasion from Kief to Novgorod, and afterward to Vladimir, where the celebrated Alexander Nevski (q. v.) (1252-63) swayed the scepter. In the beginning of the 14th c., Eastern Russia consisted of the principalities of Soustal, Nijni-Novgorod, Tver, Riazan, and Moscow, and long and bloody contests took place between the two most powerful of these, Tver and Moscow, for the supremacy. At last, under the guidance of *Ivan Kalita* (1328-40), the founder of the system of administrative centralization which prevailed down to the time of Peter the great, Moscow became the chief grand-duchy. This result was due to various causes, of which the central position of Moscow, the prevalence there of the law of primogeniture, the favor of the Mongol khan, the sympathy of the church, whose head the metropolitan had removed thither from Vladimir in 1325, and the weakness of most of the other princes, were the chief. Ivan's son and successor, *Simeon the Proud* (1340-53), followed in his father's footsteps, as did also the regency which administered the government during the reign of the weak-minded *Ivan II.* (1353-59), and the minority of his son, *Dmitri* (1359-89). Dmitri conquered Nijni-Novgorod, carried on war with success against Tver and Riazan, and profited by the weakness of the Mongol khanate, which was now divided into the four hordes of Nagaik, Crimea, Kazan, and Astrakhan, to make the first attempt to shake off the shameful yoke under which the Russians had groaned so long. His brilliant victory over the Khan Mamai on the banks of the Don (1380), which conferred on him the epithet of Donskoï, was the first step to liberation; but the succeeding khan, in revenge, burned Moscow, exacted a heavy tribute from the people, and riveted their bonds more firmly than ever. *Vassili I.* (1389-1425) obtained possession of the principality of Nijni-Novgorod with the full consent of the khan, and conquered Rostof and Murom. During his reign Russia was twice invaded by the Tartars, first under Timur, and again under Edijeï, and was at the same time attacked by the Livonians. *Vassili II. the Blind* (1425-62) reigned during a period marked with continual civil wars among the various princes for the grand-ducal throne; but from this period the division of power in eastern Russia rapidly disappeared, internal troubles ceased, and the reunited realm acquired from union the power of casting off the Tartar yoke. These results were achieved by *Ivan III.* (1462-1505), surnamed "the great," who availed himself of every opportunity for abolishing the petty principalities which owed him allegiance as grand-duke, and maneuvered so skillfully, that some of the princes voluntarily surrendered their rights, others bequeathed their lands to him; while others, as the prince of Tver, were reduced by force of arms. The heaviest task of all, however, was the reduction of Novgorod, but so vigorously did Ivan carry out his schemes, that in 1478 this last of the great principalities was added to his empire. He then took advantage of the dissensions between Achmet, khan of the Golden Horde, and Mengli-Gheraï, khan of the Crimean Horde, to deliver Russia from its state of servitude by uniting with the latter; their combined arms destroying the power of the former in 1480; and the kingdom of Astrakhan, which rose on its ruins, was wholly unable to cope with the now powerful monarchy. He next turned his attention to the western provinces, which had formerly belonged to the descendants of St. Vladimir, but were now in the hands of the Lithuanians, under whom the adherents of the Greek church were bitterly oppressed by the Catholics, and accordingly hailed the advance of Ivan's army as a deliverance from persecution. The battle which followed was in favor of the Russians, but was productive of no results of any importance. Ivan married (1472) Sophia, a niece of Constantine Palæologus, the last Byzantine emperor, and introduced the arts of civilization through the medium of architects, founders, coiners, miners, etc., whom he brought from Italy, and the result of whose labors is seen in the Kremlin, and the cathedral of the Assumption (Ouspenski Sobor). He also fortified many towns, introduced to his court the splendor of Byzantium, assumed the title of czar of all the Russias, adopted the arms of the Greek empire, and united the existing edicts into a body of laws, the *Soudebnik*. *Vassili III.* (1505-33) followed closely his father's policy, made war upon the Lithuanians, from whom he took Smolensk, and incorporated with his dominions the remainder of the small tributary principalities. His son, *Ivan IV.* (1533-84), known afterward as "the terrible," became monarch at the age of three years, and the country during his long minority was distracted by the contentions of factious bojars who strove for power. Fortunately, however, on his attaining his majority in 1547, he found two wise and prudent counselors, Sylvestre and Adascheïf, who, along with his queen, Anastasia Romanoff (see ROMANOFF), exercised over him a most beneficent influence. The interior administration was remodeled, the "soudebnik" of his grandfather was reformed and amended, the *streltzi*, the first standing army in Russia, were established, and printing introduced. His arms were everywhere victorious; the strongly fortified city of Kazan was captured in 1552, and the kingdom of which it was the capital was annexed to his empire, and the kingdom of Astrakhan shared the same fate soon after. The marauding Tartars of the Crimea were

held in check, and the knights sword-bearers attacked and driven from Livonia and Esthonia. About this time a remarkable change came over Ivan's character, which seems to have been in some way connected with the death of his wife, Anastasia. He became suspicious of every one, believed himself surrounded with traitors, banished his two counselors, Sylvestre and Adascheff, and persecuted the bojars, many of whom perished on the scaffold, while others fled to foreign countries. His insane rage fell upon whole towns; thousands of people were destroyed in Tver, Novgorod, and Moscow; and, finally, he murdered his eldest son. Stephen Bathory, king of Poland, meantime wrested Livonia from him, and the Crim-Tartars made an irruption northward, and burned Moscow. It was during the reign of this monarch that western Siberia was conquered for Russia by the Cossack Ermak. See SIBERIA. His son, Feodor (1594-98), was a feeble prince, who intrusted his brother-in-law, Boris Godounof, with the management of affairs. Godounof was a man of rare ability and intellect, and proved himself an able administrator. The Russian dominion in Siberia was consolidated, numerous towns and fortresses were erected in the s. as barriers against the Crim-Tartars, the Greek church in Russia was declared independent of the patriarch of Constantinople. Feodor was the last reigning monarch of the house of Rurik, for he died childless, and his only brother, Dmitri, was murdered in 1591 by order of Godounof, according to popular rumor. After the death of Feodor, representatives of all classes were convoked at Moscow to elect a new sovereign, and their choice fell on *Godounof* (1598-1604). The mysterious death of prince Dmitri favored the appearance of pretenders to his name and rank, the first of whom, a supposed monk of the name of Gregory Otrepieff (see DEMETRIUS), was defeated by Godounoff, but on the sudden death of the latter he was crowned in 1605. A revolt, headed by prince *Vassili Shouisky* (1606-10) soon broke out, the czar was murdered, and Shouisky elevated to the vacant throne. But a second false Dmitri now appeared, and Sigismund of Poland, taking advantage of the confusion thus produced, invaded Russia, proclaimed his son Vladislaf czar, and took possession of Moscow (1610), carrying away the czar to die in a Polish prison. At the same time hordes of Tartars, predatory bands of Poles, and gangs of robbers devastated the provinces, and the wretched country was reduced almost to the verge of complete disorganization. But the clergy nobly stood forth to save the state from ruin, and Minin, a common citizen of Nijni-Novgorod, so worked up the feelings of his fellow citizens that they volunteered for military service, and chose as their leader the prince Pojarsky, a man of distinguished valor. Pojarsky retook the capital, drove the Poles out of Russia, and evoked an assembly of representatives, who unanimously chose for their czar *Michael Feodorovitch Romanoff* (1613-45). See ROMANOFF. The first care of the new monarch was to put an end to the revolt of the Don Cossacks, who had set up the son of the first false Dmitri as czar, and to the depredations of the robber-gangs in the s.w. of Russia. In 1617 he concluded a treaty with Sweden, by virtue of which that power received the coasts of the gulf of Finland and a considerable pecuniary indemnity in consideration of Philip, the brother of the Swedish monarch, renouncing his claims to the Muscovite throne. In 1618 and 1634 he purchased peace from the Poles at the cost of Smolensk and a portion of Seversk. Having thus freed himself from all danger of foreign interference, he directed his attention to the internal administration, which, especially the courts of justice, was reduced to a deplorable condition; and to aid him in this necessary task, he summoned a general council of representatives at Moscow. *Alexei* (1645-76), his son and successor, being a minor, the nobles seized the opportunity of increasing their power and exercising oppression and extortion over their inferiors, till rebellions broke out in various districts. Other causes of discontent were the heaviness of the taxes, the oppression of the serfs, the depreciation of the currency, which was changed from silver to copper, and the secession from the Russian Greek church of those who disapproved of the changes and corrections in the books and liturgy of the church introduced by the patriarch Nikon. These malcontents were accordingly persecuted, and fled, some to the n. of Russia, and others to the Ukraine, where they founded many colonies, and still exist apart under the name of "Old Ritualists" (*Starobriady*). A general council, which was now convoked to deliberate on the best means of restoring peace to the country, revised the existing laws, and composed (1649) a new code—the "Sobornoe Ulozhenie," which granted to every subject the right of direct appeal to the czar. Tolls on the highways were abolished, the English and other foreign merchants were deprived of their privilege of free-trade with Russia, and the silver currency reintroduced. The chief events in foreign policy were the acquisition of Little Russia, by the voluntary submission of the Cossacks (see POLAND); a consequent war with Poland, in which Russia acquired Smolensk and the greater part of White Russia; and a war with Turkey, which continued till after the accession of Feodor (1676-82), when it was terminated (1681) by the treaty of Bakhtchisarai, by which Turkey gave up all claims to Little Russia. After Feodor's death, the general council of the land, in accordance with his last wishes and their own predilections, chose his half-brother Peter as czar, but his half-sister Sophia, an able and ambitious princess (see PETER THE GREAT) succeeded in obtaining the reins of power as princess-regent. She concluded peace with Poland in 1686, made two unsuccessful campaigns against the Tartars of the Crimea; and after an attempt to deprive Peter of his right to the throne, and failing this, to assassinate himself and his mother, she was forced to resign all power and retire

to a convent. All her accomplices were executed; and PETER (1689-1725) ascended the throne as sole ruler, his half-brother Ivan being allowed to retain the title of czar conjointly, and to appear as such at public ceremonies, but without any real authority. In order more fully to discover the importance of the changes wrought by Peter in Russia, a brief retrospect of its social and political condition at the date of his accession is necessary. At the head of government stood the czar with absolute power in administrative, judicial, and military affairs. In the exercise of authority he was aided by his council, the "Bojarskaia Douma," and in cases of extreme need by a general council of representatives of the people, which latter, however, possessed only a right of deliberation. The criminal code was cruel in the extreme. Of the standing army the *streltzi* only deserved the name. The population were divided into two great classes, the *bojars* or nobles, who were bound to render service for their estates, and the *burghus* or industrial and trading classes, and *serfs*, who were bound to the soil. The clergy exercised great influence over all classes, possessed offices in the "douma," and exercised political functions. Agriculture was at a low ebb, and the few manufactories and industrial establishments were in the hands of foreigners. Civilization and learning, which had been introduced during the confederative period, had never recovered the shock they had received from the Mongol invasion, but in later times they entered Russia through the connection of Novgorod with the Hanse league, and from intercourse with Poland, though they never reached the rural population or the lower classes. The education even of the higher classes was limited to reading and writing, and the first school for classics and theology only made its appearance during Feodor's reign. Fine arts were limited to architecture and painting (of sacred subjects) after the Byzantine school. The first newspaper appeared (in Moscow) and the first theater was established during the reign of Alexis. The degraded condition of civilization and the oriental influence of the Mongols left powerful traces on the domestic manners and habits of the Russians, among which was the despotic authority of the father over his household, and the low position of women in domestic life; those of the lower ranks being made mere slaves, while those of higher rank were completely excluded from social intercourse with the other sex, and were condemned to pass a dull and dreary existence in their "terems." Marriages were concluded by the parents without the consent of the bride and bridegroom.

The history of Russia during Peter I.'s reign is merely a biography of that monarch, and under his name is given a brief sketch of the numerous and important improvements effected by him in the government and civilization of his subjects. It must, however, be noted, that in the carrying out of his well-meant schemes, he seldom consulted the national character of his people, or the natural conditions of the country; and consequently, when the irresistible pressure of his high intellect and indomitable will was withdrawn, it was found that, in great part, the civilization which he had forced upon his subjects was but skin-deep. In accordance with the terms of his will, his second wife, *Catharine I.* (q.v.) (1725-27), succeeded him, though the old or anti-improvement part of the nobility supported the claims of the only son of the unfortunate Alexei (q.v.), *Peter II.* (q.v.) (1727-30), who soon after obtained the imperial throne. The reigns of both of these sovereigns were occupied with court quarrels and intrigues, *Menchikow* (q.v.) during the former, and *Dolgorouki* during the latter, being the real rulers. On the death of Peter II., the privy council, setting aside the other descendants of Peter I., conferred the crown on *Anna* (q.v.), duchess of Courland, the daughter of Ivan. Her reign (1730-40) was marked by the predominance of the German party at court, who, unchecked by the weak sovereign, treated Russia as a great emporium of plunder, and the Russians as barbarians (see *BRON*). Under their influence, Russia restored to Persia her lost Caspian provinces, and was led into a war with Turkey, which was productive of nothing but an immense loss of men and money. Her successor was *Ivan* (1740-41), the son of her niece, the duchess of Brunswick, *Anna Carlovna* (q.v.); but he was speedily dethroned by *Elizabeth* (q.v.) (1741-62), the daughter of Peter I., who deprived the German party of the influence it had so shamefully abused, restored the senate to the power with which it had been intrusted by Peter the great, established a regular system of recruiting, abolished tolls, and increased the duties on imports. During her reign, French influence was paramount, and the language of that nation supplanted German at court. Russia gained by the treaty of Abo (1743) a portion of Finland, and took part in the *seven years' war* (q.v.). Elizabeth's nephew and successor, *Peter III.* (q.v.) (1762-62), put a stop to all interference with the quarrels of western Europe, and introduced some commendable ameliorations of the oppressive enactments of his predecessors; but he was speedily dethroned by his able and unscrupulous consort, who, as *Catharine II.* (q.v.) (1762-96), ascended the throne, and proved herself the greatest sovereign of Russia after Peter I. Her successful wars with Turkey, Persia, Sweden, and Poland largely extended the limits of the empire; and while by her foreign policy protecting her subjects from external invasion, she as little forgot the necessity for internal reforms. The laws and administrative arrangements were revised, and the empire was divided into governments (an arrangement which, with very slight modification, still subsists), each government being under a separate administration, both as to matters of polity and justice. Her son and successor, *Paul I.* (q.v.) (1796-1801), at first, through apprehension of the revolution in

France, joined the Austrians and British against France, but soon after capriciously withdrew, and was about to commence war with Britain, when his assassination took place. He gave freedom of worship to the "Old Ritualists," which till this time had been withheld; but he also established a severe censorship of the press, prohibited the introduction of foreign publications, and organized a secret police. His eldest son, *Alexander I.* (q.v.) (1801-25), was at the outset desirous of peace, but was soon drawn into the vortex of the great struggle with France, in which he played a prominent, although at one period an inconsistent part, and raised Russia to the first rank among European states. The character of his rule and the internal improvements he effected are sketched under his name; and an outline of the warlike operations is given in the article *NAPOLEON*. The holy alliance (q.v.) and the example of conservative policy set by Austria, exercised a pernicious influence on the latter part of his reign; and the higher classes, who had looked for the introduction of at least a portion of the liberal institutions they had seen and admired in western Europe, became so dissatisfied, that when his youngest brother, *Nicholas I.* (q.v.) (1825-55), from whom they had nothing to hope, succeeded, they broke out into open rebellion, which was speedily crushed. A full stop was now put to the rapid advance of Russia's prosperity; wars were declared with Persia and Turkey; and a long and deadly struggle commenced with the Caucasian mountaineers—all for the ill-concealed object of extending Russian domination; and the cession of Erivan and Nahituvan by Persia, of the plain of the Kuban, of the protectorate of the Danubian principalities, and of the free right of navigation of the Black sea, the Dardanelles, and the Danube by Turkey, only whetted his appetite for more spoil. In 1830 he converted Poland (q.v.) into a Russian province; in 1849 he officiously aided Austria in quelling the insurrection of the Magyars; and in 1853 his almost irresistible craving for more territory led him (being, in all probability, under the impression that Turkey would stand alone, as she had always done hitherto) into the Crimean war, in which, though the allies, Britain, France, and Sardina, did not obtain any decided success, Russia suffered immense loss of military prestige on the Danube, at Silistria, the Alma, and before Sebastopol, and was almost drained of her vast resources of men and money. The accession of Nicholas's son, *Alexander II.* (1855)—one of whose first acts was the conclusion of the peace of Paris (1856), by which Russia lost the right of navigation on the Danube, a strip of territory to the n. of that river, and the unrestricted navigation of the Black sea—has been the signal for the revival of those schemes of reform which had been crushed so despotically by the late czar. Alexander's first great reform was the abolition of serfdom, which created 14 millions of new free citizens. Corporal punishment, and the farming-system of the indirect taxes, were also abolished; and the judicial power was separated from the administrative, and founded on trial by jury. The insurrection in Poland (q.v.), in 1863-64, was suppressed with extreme severity; and in 1868 the last relics of Polish independence disappeared in the thorough incorporation of the kingdom with the Russian empire. The subjugation of the Caucasus was completed in 1859. Successive expeditions, the last of which were those against Khiva and Khokan, have resulted in the establishment of Russian supremacy over all the states of Turkestan. In 1876, on the death of the governor-general of the Baltic provinces, their administration was merged in that of the central government. Russia in 1870 intimated that she no longer felt bound by certain conditions of the treaty of 1856, and in a conference at London in 1871 her claims were admitted. The misgovernment of her Christian subjects by Turkey, and her cruel suppression of incipient rebellion in Bulgaria in 1876, led to a conference of the European powers at Constantinople. Turkey rejected the proposals made by the conference with a view to the better administration of the subject provinces; and Russia, to enforce these concessions on Turkey, declared war in April, 1877. At first the Russian progress was rapid; but the energy displayed by the Turks during the summer compelled the invaders largely to augment their forces both in Bulgaria and in Armenia. The chief events in the war were the desperate but unsuccessful attempts to expel the Russians from the Shipka pass in the Balkans, the fall of Kars in November, the resolute defense of Plevna by Osman pasha from July till December, and the capture of the Turkish army of the Shipka in January. The armistice signed in Jan., 1878, was followed in March by the treaty of San Stefano; and after diplomatic difficulties that seemed for a time not unlikely to issue in war between Russia and England, a congress of the great powers met at Berlin in June, 1878, sanctioned the rearrangement of the Ottoman empire explained under the article *TURKEY*, and the cession to Russia of the part of Bessarabia given to Moldavia in 1856, as also of the port of Batum, of Kars, and of Ardahan.

RUSSIAN AMERICA. See *ALASKA*

RUSSIAN CHURCH, the community of Christians subject to the emperor of Russia, using the Slavonic liturgy, and following the Russian rite. Christianity was introduced into Russia in the 9th c. (see *OLGA*); but it was not till the end of the 10th that the foundation was regularly laid. In the great schism between the churches of Constantinople and Rome, the Russian church naturally followed silently in the train of Constantinople, yet, at the time of the council of Florence (1439), the adherents of the Roman church throughout Russia were as numerous as those of the Greek party. The complete

separation of the Russian church from Rome was effected in the latter part of the same century.

For more than a century from this date the Russian church continued directly subject to the patriarch of Constantinople; but in the year 1588 the patriarch Jeremias, being in Russia, held a synod of the Russian bishops, and erected the see of Moscow into a patriarchate, with jurisdiction over the entire territory; this decree being afterward confirmed by a synod held at Constantinople. This dignity, however, was subordinate to the patriarch of Constantinople, and the subordination was acquiesced in down to the reign of Alexis Michaelowitz, father of Peter the great, when the patriarch of Moscow, Nikon, refused to acknowledge it further. The pretensions of this prelate, and of his successors, however, gave offense to the czar, and one of the first among the great schemes for the reorganization of his empire, conceived by Peter the great, was the suppression of the patriarchate, and the direct subordination of the church to the headship of the emperor. He took his measures, nevertheless, with great deliberation, and on the death of the patriarch Adrian, in 1700, he contented himself with not filling up the vacant dignity, appointing in the mean time, as acting director of ecclesiastical affairs, a bishop with the title of exarch, by whom all matters of importance were to be referred, either directly to the czar, or to a council of bishops, who held their sittings at Moscow. After an interval of 20 years, the public mind having been taught to forget the patriarchate, that office was formally abolished in 1721; and the permanent administration of church affairs was placed under the direction of a council called the "holy synod," or "permanent synod," consisting of archbishop, bishops, and archimandrites, all named by the emperor. Under the direction of this council, a series of official acts and formularies, and catechetical, doctrinal, and disciplinary treatises was drawn up, by which the whole scheme of the doctrine, discipline, and church government of the Russian church was settled in detail, and to which all members of the clergy, and all officials and dignitaries, are required to subscribe. The leading principle of the new constitution thus imposed in the Russian church is the absolute supremacy of the czar; and in order to mark still more signally the principle that the crown is the source of all church dignity and of all ecclesiastical jurisdiction, the arrangement of provinces, archbishoprics, and bishoprics underwent a complete revision; the old metropolitan sees, as they became vacant, were filled up with simple bishops, and not with archbishops as before; and a new arrangement of archbishoprics was established, partly by the act of the czar himself, partly by the interposition of the permanent synod.

The constitution of the Russian church established by Peter has been maintained in substance to the present time. The holy synod is regarded as one of the great departments of the government, the minister of public worship being *ex officio* a member. One of the most cherished objects of the traditional imperial policy of Russia has been to effect a uniformity of religious profession throughout the empire. Dissent, in all its forms, has not only been discouraged, but in many cases rigorously and even cruelly repressed; and as the Roman Catholic dissentients from the Russian church form the most numerous and the most formidable class, they have generally, but more particularly under the late czar Nicholas, been the object of especial severity.

As regards doctrine, the Russian church may be regarded as identical with the common body of the Greek church (q.v.). With that church the Russian church rejects the supremacy of the pope and the double procession of the Holy Ghost. All the great leading characteristics of its discipline, too, are the same; the differences of ceremonial which exist, although in many cases considered by the Russians themselves of vital importance, being too minute to permit our entering into the detail. There is one point on which some explanation may be required. The liturgy of the Russian church is the same as that of the church of Constantinople; but it is celebrated not in the Greek but in the Slavonic language. The service books, however, are not in the modern Russian, but in the ancient language, such as when they were originally translated, with the exception of the modification which they underwent at the time of the patriarch Nikon (see RASKOLNIK, PHILIPPINS), and the further revision under czar Peter. The discipline as to the marriage of the clergy is the same as that described for the Greek church; and in carrying out the law which enforces celibacy upon bishops, the Russians adopt the same expedient with the Greeks, viz., of selecting the bishops from among the monks, who are celibates in virtue of their vow.

Besides the established Russian church, there exists also in Russia a not inconsiderable body of dissenters of various kinds. One class of these has been already described under the head RASKOLNIKS. But by far the most numerous dissenters are the Roman Catholics, who are found chiefly in Poland and White Russia. At the partition of Poland a special provision was made for the Roman Catholic people of Poland, under the new government, by the erection of an archbishopric in communion with Rome, at Mohilew, in 1783; and the organization was still more formally completed by the czar Paul, who established, in 1798, five bishoprics under that metropolitan see; and the arrangements of the congress of Vienna having somewhat deranged these ecclesiastical dispositions, a new arrangement was entered into by Pius VII. in 1818. But it cannot be doubted that the whole policy of the Russian government, in reference to the church, makes it almost impossible that they should permit free exercise of worship and of thought to the Catholics in communion with Rome. The direct legislation, and still more the practi-

cal administration of Russia in Poland, in reference to marriage, to church property, to conventual establishments, and to ecclesiastical regulations generally, has been a policy of repression and of compulsory proselytism. This policy has been more sedulously pursued since the recent reorganization of Poland. In 1867 the archbishopric of Warsaw was abolished, and all the Roman Catholics of the empire were made subject to the archbishop of Mohilev.

According to the St. Petersburg calendar for 1876, the orthodox adherents of the Russian church were upward of 60,000,000; while the Raskolniks numbered over 1,170,000. The Roman Catholics, including nearly 4,600,000 in Poland, amounted to about 7,500,000. The government's contribution for the maintenance of religion was upward of £1,350,000.

RUSSIAN LANGUAGE AND LITERATURE. Russian, a principal member of the Slavic family of languages, first became a written language in the time of Peter the great, till which period the Old Slavic—the language of the church—had been the only medium of literary expression, and had, in consequence, exercised an important influence on the Russian popular speech, as on that of other Slavic dialects. The Mongol conquest, and the preponderance of Polish elements in the western parts of the empire, have also introduced into the Russian language a great number of Mongolian and Polish expressions; in addition to which, the efforts of Peter the great to give his subjects the benefits of western culture have enlarged the Russian vocabulary, especially in arts and industry, with numerous German, French, and Dutch words. The chief characteristics of Russian, as a language, are simplicity and naturalness. The grammatical connection of sentences is slight, and the number of conjunctions scanty. Perspicuity and expressiveness are obtained by the freedom allowed in the placing of words. Auxiliary verbs and articles there are none; while personal pronouns may or may not be used along with verbs. The vocabulary of Russian is very rich—foreign words being, so to speak, Russianized. The capability of the language for forming compounds and derivatives is so great, that from a single root not less than 2,000 words are sometimes derived. The purest and most grammatical Russian is spoken in the center, about Moscow. The oldest Russian grammar is that of Ludolf (Oxf. 1696); others are the grammars of the St. Petersburg academy (1802), of Gretsch (Petersb. 1823; new ed., 1834), and of Vostokov (10th ed., Petersb. 1859). A *Russian Grammar for Englishmen* was published at St. Petersburg in 1822, and another (by Heard) in 1827. The best dictionaries are those of the Russian academy (4 vols., Petersb. 1847), of Heym (1803–5), of Schmidt (Lps. 1815), Oldekop (4 vols., 1825), Sokolov (Petersb. 1834), Reiff (1862), and Paulovski (1859). There is an English-Russian grammar and dictionary by Constantinoff (3 vols.).

The beginnings of Russian literature are contemporaneous with the introduction of Christianity by the missionaries Cyril (q. v.) and Method, who employed the Old Slavic church-tongue for literary purposes. To this earliest period belongs—besides the *Pravda Ruskaja*, a book on law—the noted history or chronicle of Nestorius. After the subjugation of Russia by the Tartars, knowledge withdrew into the shelter of the monasteries, whence proceeded several important historical works. During this period of foreign domination the Russian people seem to have sought consolation and hope in writing patriotic ballads and songs about their great hero-king, Vladimir—the Russian Charlemagne—the most celebrated of which is *Igor's Expedition against the Polovci* (Berl. 1855). When at length the country was freed from the oppression of the Mongols by Ivan I. in 1478, Russian literature received a fresh impulse, but so tardy, nevertheless, were its motions, so circumscribed its achievements, that, up to the commencement of the 18th c., the only notable names that can be mentioned are the metropolitan Makarius (died 1564), who wrote *Lives of the Saints*, etc.; Zizania, the author of a Slavic grammar (Wilna, 1596); and Matviejev (17th c.), who composed several historical and heraldic works. The czar Alexei Michailovitch (whose prime-minister Matviejev was) caused a valuable collection of Russian laws to be printed in 1644, and shortly after founded an academy at Moscow, in which grammar, rhetoric, poetry, dialectics, philosophy, and theology were taught. But from political causes the Polish element now began to predominate in Russian literature, and continued to do so, more or less, until the time of Peter the great, who made his native language the universal vehicle of communication in business and writing. He established schools and founded the famous St. Petersburg academy. During his reign, the metropolitans Demetrius (b. 1651—d. 1709) and Javorskij (b. 1658—d. 1722); the archbishop Prokopovitch (1681—1736); Sellij (d. 1746); the national historian Tatishshev (1686—1750); the poets Kantemir; and the Cossacks, Klimovskij and Danilov; were the most distinguished supports of literature. The first to place on a firm basis the Russian metrical system was Trediakovskij (1703—1769). In the period that followed the death of Peter, the writer that exercised the strongest influence on Russian literature was Lomonossov, who first drew the lines of distinction sharply between Old Slavic and Russian, and established the literary supremacy of the dialect of Great Russia. Among his successors, the poet Sumarokov (1718—1777) did great service in the development of the Russian drama; so did Kniazhnin (1742—1791), whose pieces still keep their place on the Russian stage; while Wizin (1745—1792) ranks as one of the first prose writers of his age.—Some of his prose comedies are full of the most genuine humor. Other notable names in poetry, belonging in whole or part to

this period, are Cheraskov, Oserov, prince Michailovitch, Dolgoruki, Chvostov, Petrov, Bogdanovitch, and Derzawin (q. v.), the first universally popular Russian poet. Prose literature, however, developed itself more slowly. Lomonossov was for a long time the model that was followed. Among the first to make a fresh reputation were Platon, the metropolitan of Moscow, and Lewanda (1736—1814), archpriest of Kiev; who distinguished themselves from the mass of their bombastic brethren by the strength and vigor of their thinking; the historians Sechtsherbatov (1733—1790), Boltin (1735—1792), and Muraviev (1757—1807). Still more important, in the same department, were the labors of the German, Gerh. Friedr. Müller, a native of Westphalia, who in 1755 established at St. Petersburg the first literary journal. Novikov (1744—1818) gave a powerful stimulus to the book-trade and to literary productivity, partly by his professional zeal, and partly by the publication of a satirical journal, entitled *The Painter*, which was widely read.

A new epoch in Russian literature commenced with Alexander I., who was enthusiastic in the cause of education and progress. The number of universities was raised to seven; learned societies were also increased. The great ornament of literature at this period was Karamsin (q. v.), who freed it from the trammels of the pseudo-classicism, within which it had been confined by Lomonossov. His labors were continued by Dmítriev and Batjushkov, while Shishkov combated with success the tendency to deprive the language of its Slavic character; and in the poetry of Shakovski, the national elements again reasserted themselves. Along with these may be mentioned the historian Bolchovitihov (1767—1837) and the theologian Drosdov, archbishop of Moscow; the poets Koslov, prince Alexander, Schachovski (d. 1846), one of the best comic authors of Russia, and possessed of amazing fertility; Gribojedov, Glinka, prince Vjasemski (b. 1792), a celebrated song-writer, elegist, and critic; Davidov, and Gniditsch. Mersljakov, who died a professor in Moscow, was a very able critic; while Chemnicer (1744—84) and Krylov (1768—1844) rank first among the original fabulists of Russia. Bulgarin and Gretsch belong rather to the most recent period of Russian literature—a period characterized by the predominance of Russian influences, and the complete absorption into the one national spirit of all minor and foreign elements. The late czar Nicholas labored with his wonted passionate energy in this direction. Among the poets of this thoroughly Russian period, the most conspicuous and brilliant is Pushkin (q. v.), whose verses are a mirror of Russian life, in which we see shadowed forth the joys and griefs, the humor and the patriotism, of the true Russian peasant. The most remarkable of Pushkin's contemporaries and successors are the poets Baratynski (d. 1844), baron Delvig, Benediktov, Podolinski, and Lermontov; the dramatists Nikolaus Polevoi and Nestor Kukolnik, who drew the matter of their dramas from the national history; and Gogol (q. v.), one of the most illustrious names in Russian literature. Russian novels exhibit a condition of society in which barbarism struggles for supremacy with a superficial civilization. The best writers in this department are Bestushev, Bulgarin, Sagoskin, whose most popular work, *Jury Mloslavski, or the Russians in 1612*, is modeled after the historical manner of sir Walter Scott; Vasili Ushakov, author of *Kirgis-Kaisak*, etc.; Count Solohub, whose novels give a graphic picture of St. Petersburg society; prince Odojevski, baron Theodor Korff, Konst. Masalski, and Senkovski, reckoned one of the first journalists in Russia; nor must the name of Alexander Herzen (q. v.), the "liberal Russian" exile, be omitted. The delineations of Cossack life are too numerous for special notice, but they constitute quite a distinct section of the literature of Russian fiction, and are composed for the most part in the dialect of Little Russia. Great attention has also been paid in Russia, as in all Slavic countries, to popular songs and proverbs. The principal collections of these are by Novikov, Kashin, Maximovitch, Makarov, and Sacharov. The latest developments of Russian literature have been chiefly in the department of history, and among the most distinguished names are those of prof. Ustrialov of St. Petersburg, prof. Pogodin of Moscow, Polevoi, Vasili Berg (d. 1834), lieut. gen. Michailovski Danilevski, prof. Snjgirev, Sreznevski, Slovzov, Samailov, Solovjev, Strovjev, Neverov, and Arsenjev. Such philosophy as exists in Russia is mainly an echo of the modern German schools, and therefore possesses no particular originality. Advances in theology are hardly to be looked for as yet from a church so deeply sunk in ignorance and intellectual stuper as the Russian, yet nowhere is reform more urgently required. As writers on jurisprudence, Nevolin, Moroshkin, Spassovitch, deserve mention; amongst mathematicians, Euzacnov, Perevoschtschikov, Wesselovski; amongst physicists, Turtchaninov, Metzchukov, Sokolov, Kutorga, Kokscharov; and as linguists, Vostokov, Biliarski, Buslajev. See Borg, *Poetic Works of the Russians* (Gr. 2 vols. Riga. 1823); Gretsch, *Extracts from the Poets and Prose-writers of Russia* (St. Petersburg, 1821); Gretsch's *History of Russian Literature* (Peterb. 1822); Jevgenij, *History of Russian Literature* (Peterb. 1818—27—38); König, *Literary Pictures from Russia* (Stuttg. 1837); Otto, *Text-book of Russian Literature* (Lps. 1837; translated into English by Cox, Oxford, 1839); Jordan, *History of Russian Literature* (Lps. 1846); and Talvi (Mrs. Robinson), *Historical View of the Languages and Literature of the Slavic Nations* (New York, 1850).

RUSSIAS, ALL THE, the official designation of the Russian empire in Europe, was assumed in 1654, when the czar Alexei Michailowitch styled himself for the first time "Czar of all the Russias," after his conquest of Little Russia and acquisition of Smolensk from Poland. This phrase at first included only Great Russia, White Russia, and Little

Russia. *Great Russia*, formerly called Muscovy, which is by far the largest of these three divisions, includes the territory now comprehended in the 19 governments of Archangel, Olonetz, Vologda, Noygorod, Tver, Jaroslav, Kostroma, Pskov, Smolensk (partly), Moscow, Vladimir, Nijni Novgorod, Kalouga, Toulá, Riazan, Tambov, Orel, Koursk, and Voronetz.—*White Russia* included the provinces of Vitebsk, Mohilev, and the rest of Smolensk, and, though long held by the Poles, was re-united to Russia at the first and second partitions of Poland (1772 and 1793). In 1793 it also received the accession of the Polish provinces which now form the governments of Vilna, Minsk, Kovno, Volhynia, Podolsk; and White Russia with these accessions was then denominated *West Russia*.—*Little Russia* contains the ancient Russian possessions in the south-west, which, in the middle ages, became independent under the Cossacks of the Ukraine, and were finally reunited to Russia in 1654; and is divided into the four provinces of Kiev, Tchernigov, Poltava, and Kharkov. During the 18th c. the countries wrested from the Turks, lying between Great Russia and the Black sea, were formed into a fourth great division, under the name of *Southern Russia*. This last includes the districts occupied by the Don Cossacks, sometimes called *New Russia*.—*Red Russia* was a portion of the Russian principality of Galicia (Galicia), and, with the rest of it, was subdued by Casimir III. of Poland; it included what is now the province of Lublin, in the kingdom of Poland, and the eastern portion of Austrian Galicia, and is inhabited by Poles, and another and antagonistic people called Russniaks (q.v.).

RUSS NIAKS, also **RUSSINE** and **RUTHENI**, the name of a variety of peoples who form a branch of the great Slavic race, and are sharply distinguished from the Muscovites, or Russians proper, by their language and the entire character of their life. They are divided into the Russniaks of Galicia, North Hungary, Podolia, Volhynia, and Lithuania, and are estimated by Schafarik at 13,000,000. They are almost all agriculturists, and, on the whole, rather uncultivated. Before the 17th c., they were a free race, but were then subjugated, partly by the Lithuanians, partly by the Poles, and for a long time belonged to the Polish kingdom. Their language has consequently become closely assimilated to the Polish. In earlier times it was a written speech, with quite distinctive characteristics, as may be seen from the translation of the Bible, published at Ostrog, in 1581, and from various statutes and other literary monuments still extant. Recently, printing in the Russniak tongue has been recommenced. The Russniaks belong, for the most part, to the United Greek church, but in part also to the non-united. They preserve many old customs peculiar to themselves, and much folk-lore, prose and poetic, very like that current in Poland and Servia. This has been collected by Vaclav in his *Piesni Polskie i Ruskie* (Lemberg, 1833). Levicki has published a *Grammatik der Russinischen Sprache für Deutsche* (Przemysl, 1833).

RUSSO-GERMAN WAR, the name given by German historians to the last stage of the great European war against Napoleon, beginning with the Russian campaign of 1812 and terminating on the field of Waterloo. See **NAPOLEON**.

RUST, the name given to a disease of plants, which shows itself on the stems and leaves of many plants, and on the ears of grasses, both of the cereal grasses, and of many pasture or forage grasses; in brown, yellow, or orange-colored spots; and after destroying the epidermis of the plant, assumes the form of a powder, which soils the fingers when touched. Rust seems to consist at first of small fungi of one cell, sometimes divided by a transverse wall, belonging to the genera *uredo* and *puccinia*; which, finally, breaking through the diseased epidermis, form a colored dust consisting of mere spores. The name rust is sometimes restricted to the *uredo rubigo cerea*, but it is doubted by some if this is not really a young state of a *puccinia*. Not a few authors regard rust as an eruptive disease (*exanthema*), which makes its appearance chiefly in damp weather, and sometimes extends so far as seriously to injure the plants affected by it, the mycelium and spores which appear in it being regarded as present accidentally, or in consequence of the disease. This, however, is the least probable opinion concerning it.—Rust is sometimes very injurious to crops. No remedy is known for it; but it is certain that rank manures tend to produce or aggravate it. See **UREDIO**.

RUSTCHUK, an important t. of the principality of Bulgaria, and 70 m. w.s.w. of Silistria, on the s. bank of the Danube, opposite Giurgevo. Its position on a range of hills, with its white chimneys, its mosques and minarets rising from amid forests of fruit-trees, give it a striking and picturesque appearance. The Danube is here about 2 m. wide, but its channel is marked with islets and shallows. Rustchuk has manufactures of meerscham pipes, pottery, saddlery, leather, cloth, tobacco, and silk, and is connected by rail with Varna. It was determined by the Berlin congress in 1878 that the fortifications of Rustchuk, extensive, but not very important, should, like those of the other Bulgarian fortresses, be destroyed. Pop., of which nearly half are Mohammedans, 30,000.

RUSTIC, or **RUSTICATED WORK** and **RUSTICATION**. The name of that kind of masonry in which the various stones or courses are marked at the joints by plays or recesses. The surface of the stone is sometimes left rough, and sometimes polished or otherwise dressed. Rustication is chiefly used in classical or Italian architecture, although rustic quoins (q.v.) are often used in rough Gothic work.

RUSTRE, in heraldry, one of the subordinaries, consisting of a lozenge (q. v.) with a circular opening pierced in its center. Ancient armor was sometimes composed of rustres sewed on cloth.

RUTA-BAGA. See **TURNIP**.

RUTA'CEÆ, a natural order of exogenous plants, consisting mostly of trees and shrubs, but containing a few herbaceous plants. The leaves have no stipules, are simple and entire, lobed, pinnates, or decomposed, and are covered with pellucid resinous dots. The flowers are hermaphrodite, sometimes irregular. The calyx has four or five segments; the petals are equal in number to its segments, or wanting, or are united into a monopetalous corolla; the stamens are equal in number to them, or fewer by abortion, or twice or thrice as many. There is a cup-shaped disk. The ovary is sometimes stalked; it has as many carpels as there are petals, or fewer; there are generally two ovules in each carpel. The fruit consists of several capsules, cohering firmly or imperfectly.—There are about 400 known species, natives of the warmer temperate and of tropical regions. The *diosmaceæ* are sometimes separated as a distinct order. A bitter taste and powerful odor are general characteristics. Rue, bucku, and dittany are examples of the order. See also **ANGOSTURA BARK** and **BRUCEA**. The barks of a number of tropical species, of different genera, possess febrifugal properties.

RUTGERS, HENRY, 1746-1830; b. New York; educated at Columbia college. He was a capt. in the revolutionary war, several times a member of the New York assembly, and a regent of the university of New York. Rutgers college, to which he gave \$5,000, bears his name.

RUTGERS COLLEGE, in New Brunswick, N. J., originally organized by royal charter in 1770, with the title of "Queen's College," which it bore until 1825, when the present name was adopted in honor of col. Henry Rutgers, who made liberal contributions to its fund. It was formerly connected officially with the Protestant Reformed Dutch church, under whose fostering care it grew from a feeble beginning to a high state of prosperity. In 1865 the synod abrogated its official relations to the institution, which thereupon became independent with the exception that the president and three fourths of the trustees are required to be members in full communion of the church by which it was founded. It has an endowment of between \$300,000 and \$400,000. It has a beautiful campus, well shaded, and eight buildings, well adapted to their respective uses. Its laboratories are large and furnished with excellent apparatus. Its cabinets and collections fill a museum 90 ft. in length by 40 ft. in width, with galleries all around. It has a library of 8,000 volumes, besides the libraries of the literary societies. It has 14 professors, 1 tutor, and 150 students. Its alumni number 1400, including some men of eminence in professional and public life. It has a scientific department, known as the "State Agricultural College of New Jersey, for the benefit of agriculture and the mechanic arts," with 14 professors and 41 students. There is a gymnasium connected with the theological seminary, which is open to the college students. Instruction is given in military tactics, but without drill. A grammar school has been connected with the college for 100 years, and has now about 100 pupils. The first president was J. R. Hardenbergh, D.D.; the second, John H. Livingston, D.D. Its later presidents have been: Philip Milledoler, D.D., 1825-40; Abraham R. Hasbrouck, LL.D., 1840-50; Theodore Frelinghuysen, LL.D., 1850-62; William H. Campbell, D.D., LL.D., 1863, now in office.

RUTH, BOOK of, one of the Hagiographa, placed in the authorized version, as in the LXX., between Judges and Samuel; and in the Jewish canon, as the second of the five Megilloth, coming after the Song of Songs. It consists of four chapters, and describes how Ruth, the Moabite widow of a Hebrew, Machlon by name, in the time of the Judges, became—by faithful, loving adherence to her mother-in-law, Naomi, for whose sake she had left her home and kindred—the wife of Boaz, and through him the ancestress of David himself. A fragmentary genealogy of David's house—of which the principal links only are given—forms the conclusion of the book, which is characterized throughout by the most naïve simplicity and minute truthfulness of detail. If there be a tendency in the book—which is doubtful—it would naturally be to show how utterly even that strictest of prejudices, in the mind of ancient peoples, especially the Hebrews, against intermarriage with the "stranger," is vanquished by genuine human love and piety; nay, that the heroine of the tale, even a Moabite, was deemed worthy for her virtue to become the foundress of the royal house of Israel. Considering that the book of Kings contains no details about David's genealogy, this book, apart from its indescribable natural charm, becomes a most useful historical record, and further supplies many items on the forms and domestic customs of a time about which we have such very scant information elsewhere.

The time of the events related mounts back to about a century before David, yet both the contents and tendency of the book show clearly enough that it was hardly written before the last years of David's reign, if it was at all written in his lifetime. For a change had already taken place in the interval in the manners and customs of the people (cf. the "in former time," iv. 7), and the genealogy carried down to David, shows the theocratic significance he had acquired by the time it was written.

RUTH, BOOK OF (*ante*), has an undisputed place among the canonical books of the Old Testament. The ancient Jews regarded it as a part of the book of Judges. Its date and author are unknown, though Jewish tradition ascribes it to Samuel. As the time is said to have been "in the days when the judges ruled," it is probable that those days had passed away before the book was written. As a romantic story of ancient oriental domestic life this little book is deeply interesting. The character of Ruth, drawn with great simplicity and skill, has been attractive through many generations and in many lands. Her history strikingly illustrates the providence of God; showing that it extends to individuals, and to the afflicted and destitute; that it overrules calamities, rewards filial piety, and under the Jewish dispensation accepted the consecration even of heathen and foreigners. It has importance in its relation to God's great work of redemption for the world. While different historical books of the Old Testament record the line of Jewish ancestry from whom the Messiah was to descend, the book of Ruth unfolds the providential events by which a heathen woman was introduced into the nation and became a "a mother in Israel" from whom were born David and his greater son, Jesus the Christ.

RUTHENIANS. See **RUSSNIACS.**

RUTHENIUM (symb. Ru, equiv. 52—new system, 104—spec. grav. 11.3) is a metal discovered in 1843 by Claus in the ore of platinum. In most respects, excepting in its specific gravity, it closely resembles iridium, the colored reaction of the salts being almost without exception the same in both. For details regarding this metal, which is of no practical importance, the reader may consult Deville and Debray's "Memoir on Platinum and its Ores," in the *Annale de Chimie et de Physique*, for 1859.

RUTHENIUM (*ante*) is in that portion of platinum ore which is called osmiridium. When crude platinum is dissolved in nitro-muriatic acid a small quantity of a gray, scaly, metallic substance usually remains behind. This is a native alloy of iridium, osmium, and ruthenium. This is called scaly osmiridium, and is the variety which is the source of extraction of ruthenium. Another variety, also a residue of the same process of digestion of the platinum ore in nitro-muriatic acid, is granular, and rich in iridium and rhodium. To obtain ruthenium, scaly osmiridium is heated to bright redness in a porcelain tube, through which a current of air freed from carbonic acid and organic matter is drawn by an aspirator. This operation produces oxidation of the osmium and ruthenium, the osmium oxide being carried forward and condensed in a solution of caustic potash, while the oxide of ruthenium remains behind, together with the iridium. This residue is then fused with caustic potash, the mass treated with water and allowed to stand in a corked bottle about two hours to clarify. After precipitation an orange-colored solution of ruthenate of potassium is obtained, which, when neutralized with nitric acid, deposits velvet-black sesquioxide of ruthenium, which, when washed, dried, and ignited in hydrogen, yields the metal. Thus prepared, ruthenium is in porous lumps having a specific gravity of 8.6. It is the most refractory of all metals except osmium, but it may be fused by placing it in the hottest part of the oxyhydrogen flame (see **OXYHYDROGEN BLOW-PIPE**). After fusion its density is 11.4. It is attacked with difficulty by nitro-muriatic acid, but will yield to oxidizing reagents more readily than platinum, or even silver; therefore potash is used in extracting it as above described. There are three chlorides of ruthenium, RuCl_2 , RuCl_3 , and RuCl_4 . There are five oxides, RuO , Ru_2O_3 , RuO_2 , RuO_3 , and RuO_4 . The tetroxide, like the tetrachloride, is known only in combination. Sulphureted hydrogen gas, when passed into a solution of either of the chlorides of ruthenium, forms a precipitate of sulphide and oxysulphide of ruthenium mixed with free sulphur. The blue solution of the dichloride yields with sulphureted hydrogen a dark-brown sesquisulphide, Ru_2S_3 . When sulphureted hydrogen is passed for a long time into a solution of the trichloride, disulphide of ruthenium is precipitated, which becomes dark brown by calcination. There are several ammoniacal salts.

RUTHERFORD, a co. in s.w. North Carolina, adjoining South Carolina; watered by Broad river; about 870 sq.m.; pop. '80, 15,198—15,184 of American birth, 3,273 colored. The surface is hilly. The soil is only partly fertile. The principal productions are corn, wheat, oats, tobacco, cotton, wool, and molasses. Co. seat, Rutherfordton.

RUTHERFORD, a co. in central Tennessee; drained by Stone river and many creeks; traversed by the Nashville and Chattanooga railroad; 530 sq.m.; pop. '80, 36,741—36,653 of American birth, 16,493 colored. The surface is broken, and the soil fertile; cotton, corn, tobacco, wheat, cattle, and pork are the chief products. Co. seat, Murfreesborough.

RUTHERFORD, GRIFFITH, d. 1794; b. Ireland; came to this country and lived in the Locke settlement, N. C.; represented Rowena co. in the convention at New Berne, 1775. In 1776 he conducted an expedition of South Carolinians against the Cherokees, destroying their villages. In 1780 he was taken prisoner in the battle near Camden while in command of a brigade; was exchanged and on duty at the evacuation of Wilmington by the British. He was a member of the state senate 1784, removed to Tennessee, and was president of the legislative council of that state 1794. Two counties were named in his honor, one in each state which had claimed his public services.

RUTHERFORD, JOHN, 1760-1840; b. New York, nephew of the earl of Stirling; graduated at Princeton college 1776, studied law, and became very wealthy by land investments. He was elected U. S. senator from New Jersey in 1791, and was three times chosen presidential elector.

RUTHERFORD, SAMUEL, 1600-61; b. Scotland; graduated at the university of Edinburgh in 1621; was minister of Anworth in 1627, but silenced in 1636 for preaching against "The Articles of Perth." During the rebellion he was a zealous defender of Presbyterianism. He was professor of divinity in the New college, St. Andrews, in 1639; commissioner to the Westminster assembly, 1643-47; principal of New college in 1649; and was soon made rector of the university. Of his numerous works the following are the most important: *Exercitationes Apologetice pro Divina Gratia contra Jesuitas et Arminianos*; *Due Right of Presbyteries*; *Lex Rex*; *The Law and the Prince*; *Trial and Triumph of Faith*; *Survey of the Spiritual Antichrist*; *Divine Right of Church Government*; *A Free Disputation against Pretended Liberty of Conscience*; *Religious Letters*.

RUTHERFURD, LEWIS MORRIS, b. N. Y., 1816; graduated at Williams college 1834; is a lawyer by profession, and has devoted his leisure hours to science; for 25 years has made original investigations in astronomical photography, and has constructed admirable micrometers and other mechanical contrivances which facilitate telescopic and spectroscopic observations.

RUTHERGLEN, or, by popular abbreviation, **RUGLEN**, a royal, parliamentary, and municipal burgh, in Lanarkshire, on the Clyde, 3 m. s.e. of Glasgow. It consists of one long wide street and of several narrow streets or lanes branching from it at right angles. In ancient times it was a place of considerable importance, carried on a large traffic on the river, and embraced Glasgow within its municipal boundaries. Its trade is now mainly dependent upon that of Glasgow, and its inhabitants are employed in weaving muslins for Glasgow manufacturers, and in the mills, print, chemical, and dye-works, and collieries of the burgh and vicinity. Pop. '71, 9,543. In parliamentary representation, it is one of the Kilmarnock district of burghs.

RUTHIN, a municipal and parliamentary borough of North Wales, in the county of Denbigh, 8 m. s.e. of the town of that name, stands on the summit and slope of a hill on the right bank of the Clwyd. The site of the ancient castle, said to have been built in the reign of Edward I., is occupied by a fine modern castellated edifice in Gothic. Pop. '71, 3,298.

RUTHVEN, RAID OF, a conspiracy of note in Scottish history, contrived and executed in 1583 by William, first earl of Gowrie, father of the principal actor in the Gowrie conspiracy (q. v.), in conjunction with lord Lindsay of the Byres, the earl of Mar, and the master of Glamis. The object of the conspirators was to obtain the control of the state by seizing the person of James VI., then a boy of 16, and under the guardianship of the duke of Lennox and earl of Arran. The king being by invitation at Gowrie's seat of Ruthven castle, the conspirators assembled 1000 of their vassals, surrounded the castle, and obtained complete possession of James. Arran was thrown into prison, and Lennox retired to France, where he died broken-hearted. The Presbyterian clergy warmly espoused the cause of the Ruthven lords, who received the thanks of the general assembly, and full indemnity from a convention of estates. Nearly a year elapsed before the king regained his freedom. His feigned acquiescence in his position led the confederates so to relax their vigilance that he was enabled to throw himself into the castle of St. Andrews, whose keeper was in his confidence, and thus to become his own master. Gowrie and the other lords made their submission, and were pardoned; but soon afterward a royal proclamation characterized their enterprise as treason. Gowrie was commanded to leave Scotland; but while waiting for a vessel at Dundee, he was drawn into a conspiracy to surprise the castle of Stirling, for which he was tried and executed.

RUTILE, a mineral, which is essentially *oxide of titanium* or *titanic acid*, although generally containing a little peroxide of iron. It is of a brown, red, or yellow color; and is found massive, disseminated, in thin laminae, and in four-sided or six-sided prisms, which are sometimes needle-like, and permeate rock-crystal. It is found also in granite, syenite, gneiss, mica-slate, limestone, chlorite-slate, etc., and its geographic distribution is very wide. It is used to give a yellow color to porcelain.

RUTLAND, a co. in w. Vermont, bordering on New York; bounded by lake Champlain on the w.; drained by Castleton, Poultney, and other small rivers; traversed by the Vermont Central, the Rensselaer and Saratoga, and the Harlem Extension railroads; 950 sq. m.; pop. '80, 41,830-35,342 of American birth. The surface is mountainous; the highest peak, Killington, is 4,221 ft. high. Hay, wool, potatoes, dairy products, maple sugar, and lumber are the staples. Marble quarries are worked and slate is found. Co. seat, Rutland.

RUTLAND, a t. in central Vermont, chartered as Socialborough, 1772; incorporated 1847; capital of Rutland co. since 1781. In 1784-1804 it was one of the capitals of the state; in the former year a state-house was erected, which is still standing. U. S. courts have been held here since 1791, the date of the admission of Vermont into the union. It was a frontier town during the revolutionary war, having two forts. It is very pleas-

antly situated on Otter creek; about 6 m. sq.; pop. '80, 12,149. It is on the Rutland and Burlington railroad, the n. terminus of the Harlem Extension, and the e. terminus of the Rutland and Washington, and of the Rutland and Whitehall railroads, and the n.e. terminus of the Rensselaer and Saratoga. It is regularly built, with streets crossing each other at right angles, in a valley between the Green mountain range on the e. and Taconic range on the west. The fashionable watering-place of Clarendon Springs is 6 m. distant. It has many fine residences, 3 brick hotels, 11 churches, public schools, several private schools, the Rutland military institute, 2 Roman Catholic convents, 4 newspapers, 3 national banks with an aggregate capital of \$1,000,000, a savings bank with deposits amounting to \$650,000, and an efficient fire department. It contains 4 post-offices, Rutland, West Rutland, Centre Rutland, and Sutherland Falls. It has 4 public libraries, and a public reading-room. In the vicinity are extensive ledges of limestone, and the variety called Rutland marble, beds of which lie in the course of Otter creek, and were first quarried in 1830. At West Rutland quarries were opened in 1838, which since 1843 have become the center of the marble interest, and are principally owned by the Rutland Marble company. The business was started by William F. Barnes, who bought the ledges, now known to be of incalculable value, for a yoke of oxen. White marble is found as fine as Carrara, and variegated and brecciated marble. The 16 quarries now being worked employ 750 men; annual production, 2,500,000 sq. ft. of 2 in. marble, and large quantities are exported in blocks; other articles of export are wool, butter, cheese, and slate. Among the manufactures are the channeling machines of the Steam-Cutter company, which have greatly facilitated the production of marble. It has 3 foundries.

RUTLANDSHIRE, the smallest county in England, is bounded on the n.e. by Lincoln, on the s.e. by Northampton, and on the w. by Leicester. Area, 94,889 acres; pop. '71, 22,073. The Wash divides it into two portions, of which the northern is a somewhat elevated table-land, while the southern consists of a number of valleys running e. and w., and separated by low hills. The principal streams are the Welland, forming the boundary on the s.e., and its affluents, the Wash and Chater. Rutlandshire has no manufactures, and its chief mineral production is fine building stone. The climate is mild and healthy, the soil loamy and rich, and there is hardly an acre of waste land in the county. It is not, however, a crop-producing, but a grazing country; and oxen and sheep are reared in great numbers. Rutlandshire, which abounds in pleasing scenery, contains many stately mansions, as well as a number of ecclesiastical remains dating from the Norman period. It returns two members to the house of commons.

RUTLEDGE, EDWARD, 1749-1800; b. S.C.; brother of John. He read law in London, and practiced with success in Charleston. He was a member of the continental congress 1774-77, and of the board of war in 1776. In the latter year he was a joint commissioner with John Adams and Franklin to treat with lord Howe in regard to peace. He was re-elected to congress in 1779, but did not sit on account of illness. He was taken prisoner at Charleston in 1780, and confined at St. Augustine for 11 months. He was governor of the state from 1798 till his death.

RUTLEDGE, JOHN, 1739-1800; b. S.C.; received a legal education in London; began to practice law at Charleston in 1761, and soon rose to the first rank in his profession. He sat in the stamp act congress at New York in 1765, in the South Carolina convention in 1774, and the continental congress of 1774 and 1775. He was chairman of the committee which framed the new constitution for South Carolina in 1776, and first president under that constitution. In 1779 he was governor of the state, and during the siege of Charleston was given absolute power by the legislature. On the surrender of that town in 1780 he joined the army in the s., with which he remained till the end of the war. He was a member of congress in 1782, chancellor of his state in 1784, member of the convention which framed the federal constitution, and of the state convention which adopted it. In 1789 he was appointed an associate justice of the U.S. supreme court; in 1791 chief-justice of South Carolina, and in 1795 chief-justice of the United States. The latter appointment was not confirmed by the senate.

RUTULI, an ancient Italian people on the coast of Latium, below the mouth of the Tiber. They belonged to the Pelasgic race; originally separated from the Latini, with whom they were afterward incorporated. Their capital was Ardea, which came into the hands of the Romans about 490 B.C. According to the *Æneid*, Turnus was their king, and hostile to Latinus, who had married his daughter to Æneas, having first promised her to Turnus.

RUVIGADO, a t. of the United States of Colombia, in the department of Cundinamarca. Pop. 10,000.

RUVO IN APULIA, a city of southern Italy, province of Bari, and 22 m. w. of the city of that name. Pop. '72, 15,055. It is built upon a rising ground, contains many churches, and two museums of Italo-Grecian vases, and is famous for its potteries. The staple produce is grain, pulse, and dried fruits. Ruvo in Apulia is the Rubi of Horace.

RUYSBROEK, JOHN, 1293-1381; b. Ruysbroek, near Brussels; became vicar of the church of St. Gudula at Brussels in 1316, living as an ascetic, composing books, exercising benevolence, and laboring for reform. He renounced the secular priesthood in

1352, and entered the new Augustinian convent of Grönendal, near Brussels, of which he became the first prior. He was the leader of the Dutch and German mystics who held that oneness with God was to be attained by meditation. The name *Doctor Ecstaticus* was applied to him. He produced numerous mystical writings, and is regarded in Holland as "the best prose writer of the Netherlands in the middle ages."

RUYSDAEL, or **RUISDAEL**, **JAKOB**, was b. at Haarlem. The date of his birth is uncertain; some make it 1625, others 1630 or 1635. It is said that there is a picture by him signed and dated 1645, which makes the last date improbable. He died in 1681. It has been stated that for some years he directed his attention to the study and practice of surgery, but was advised by his friend Nicholas Berghem to devote his time to painting. In his pictures the trees are excellent in form, the foliage touched with sharpness and precision, and the skies are light and floating. His style of composition is entirely original, and characterized by a certain compactness in the arrangement; the Italian painters have generally groups of trees at the sides, and running out of the picture; in Ruysdael's compositions they are almost always massed within the picture. Ruysdael and Hobbima hold about an equal position—namely, that of the best landscape-painters of the Dutch school; but Ruysdael was also equally eminent for his sea-pieces. His etchings, seven in number, are much prized by collectors. Jan van Kessel and Jan Renier de Vries were imitators of Ruysdael. His elder brother, *Salomo* (b. circa 1613, d. 1676), was also a painter of some note.

RUYSSELEDE, a t. in w. Flanders, Belgium; pop. about 7,500. It is the seat of a celebrated reformatory institution for boys and girls. This institution, which was founded by the government in 1849, is intended for beggars, vagrants, etc., liable to become members of the criminal classes. It consists of two separate schools for boys, and one for girls. The limits of admission are between 7 and 18 years, commitments being made for minority. The inmates are taught various trades, and in the summer and spring work upon a model farm of 240 acres, finely stocked with cattle, and having attached to it a kitchen-garden of about 20 acres. The reformatory not only pays expenses, but leaves a good profit. Some of the boys are trained for the sea. The girls work in the laundry, sew, make lace, etc. The earnings are over \$20,000 annually. The inmates remain at the school, on an average, 3 years. Most of them turn out well. Over 5,000 boys have been members of the institution.

RUYTER, **MICHAEL ADRIAANSZON VAN**, Dutch admiral, was b. at Vlissingen in 1607, of poor parents, who sent him to sea as a cabin-boy when only 11 years old. He became a warrant officer, and in 1635 rose to be a capt. in the Dutch navy. After serving several years in the Indian seas, he was, in 1645, made rear-admiral. He engaged and sunk a piratic Algerine squadron off Sallee in 1647. In 1652, when war broke out between the States and England, then under the protectorate, he was placed in command of a squadron, and ordered to convoy a large number of merchant-ships. He was met by the English fleet under sir G. Ayscough off Plymouth, and an engagement took place. Neither of the fleets gained any decisive advantage; but Ruyter succeeded in saving his convoy. In 1653, when a fight of 3 days took place between the English and Dutch fleets off Portland, Ruyter commanded a division under Van Tromp. The English, under Blake, finally obtained a great victory, taking and destroying 11 Dutch men-of-war and 30 merchantmen. The States-General, in 1659, sent him to assist Denmark against Sweden. He defeated the Swedish fleet, and obtained a title of nobility and a pension from the king of Denmark. In 1664 he fell upon the English factories at Cape Verde, and attempted to seize the island of Barbadoes. As other depredations of the Dutch upon English merchants, as well in the East Indies as on the high seas, were complained of, war was declared against the Dutch. In June, 1666, Ruyter and Van Tromp, with 90 sail, engaged the English fleet under prince Rupert and the duke of Albemarle. Both sides fought with such obstinacy that the battle lasted four days, and ended without any decisive result. In July the conflict was renewed, when the English gained a complete victory, destroying above 20 of Ruyter's men-of-war. In 1667 he destroyed the shipping at Sheerness, sailed up the Medway as far as Chatham, burned several English men-of-war, and effected more toward the conclusion of peace at Breda (1667) than any diplomatist. In 1671 he commanded the Dutch fleet and fought several battles with the combined English and French fleets, but without decisive results. In 1675 he was sent to the Mediterranean. He fought off the coast of Sicily, a desperate battle with the French fleet, under the celebrated admiral Duquesne. Victory declared itself on the side of the French; but Ruyter made good his retreat into the harbor of Syracuse. He had his legs shattered in the engagement, and died of his wounds, April, 1676. Europe did justice to his bravery; and Louis XIV. said he could not help regretting the loss of a great man, although an enemy. His death was deeply mourned by his countrymen, and a splendid monument was erected to his memory at Amsterdam.

RYAN, **STEPHEN VINCENT**, D.D., b. Upper Canada, 1826; educated at St. Charles's seminary, Philadelphia, and at St. Mary's seminary, Barrens, Mo.; ordained Roman Catholic priest in St. Louis in 1849; professor at St. Mary's seminary; president of St. Vincent's college, Cape Girardeau, Mo., in 1856; consecrated bishop of Buffalo in 1868.

RYAN, **LOCH**. See **WIGTOWNSHIRE**.

RYBINSK, a district t. of Great Russia, in the government of Jaroslav, stands on the right bank of the Volga, 418 m. e.s.e. of St. Petersburg. It is the great center of the corn trade on the Volga, and, after Nijni-Novgorod, is the chief commercial center on that river. The trade of Rybinsk consists principally in transshipping and forwarding to the capital the goods brought hither by large vessels up the Volga. For this purpose, upward of 6,000 barges are built here every year. The landing-place extends along the river for several miles, and is divided into 9 sections, each of which is appropriated to special varieties of goods. The chief articles of trade are corn, flour, tallow, spirits, metals, and timber, and these are forwarded to St. Petersburg by 3 systems of communications, of which the Mariinsky canal conveys goods to the value of £5,000,000; the Tichvin canal, goods to the value of £4,000,000; and the Vyshnivolsk canal, goods to the value of £2,000,000. There is, besides, the railway. Pop. '67, 14,600.

RYDE, a flourishing and fashionable watering-place and market-t., on the n. coast of the isle of Wight, Hampshire, occupies the e. and n. slopes of a hill, 6 m. s.s.w. of Portsmouth, from which it is separated by the roadstead of Spit Head. It consists of Upper and Lower Ryde; the former anciently called *Rye*, or *La Riche*, and the latter of quite modern construction. The shores are wooded to the verge of the water, and the appearance of the town, with its streets and houses interspersed with trees, is pleasing and picturesque. The pier, nearly a mile in length, forms an excellent promenade. Yacht and boat-building are carried on to some extent. Steamers cross every hour to Portsmouth; in summer, and several times a day in winter. Ryde, the largest town in the island, had, in 1871, 11,260 inhabitants. Ryde is connected with Ventnor by a railway.

RYDER, JAMES, D.D., 1800-60; b. Dublin; came to America in early youth; entered the novitiate of the society of Jesuits in 1815; studied at Georgetown college, Md., 1815-20; at Rome, 1820-25; ordained at Rome in 1825; was professor of theology and the sacred Scriptures in the college of Spoleto, Italy, 1825-28; was for several years professor of theology and philosophy in Georgetown college, and also its vice-president; pastor of St. Mary's church, Philadelphia, in 1839; and of St. John's church, Frederick, Md., in 1840; president of Georgetown college, 1840-45, and again, 1848-51; president of the college of the Holy Cross, Worcester, Mass., 1845-48. He was also superior of the order of Jesuits in North America. He was a contributor to the *Encyclopædia Americana*, and has published some *Lectures* and *Discourses*.

RYDER, WILLIAM HENRY, D.D., b. Mass., 1822; ordained and became pastor of a Universalist church in Concord, N. H., 1843; and of a church in Nashua 1845. In 1848 he visited Europe and Palestine; studied in Berlin; settled as pastor in Roxbury, Mass., in 1850, and in 1869 at St. Paul's church in Chicago, Ill.

RYE, Secale, a genus of grasses, allied to wheat and barley, and having spikes which generally consist of two-flowered, rarely of three-flowered, spikelets; the florets furnished with terminal awns, only the upper floret stalked. One species (*S. cereale*) is a well-known grain. It has when in fruit a roundish-quadrangular spike with a tough rachis. Its native country, as in the case of the other most important cereals, is somewhat doubtful; but it is said to be found wild in the desert regions near the Caspian sea and on the highest mountains of the Crimea. It has long been cultivated as a cereal plant, although the supposed mention of it in Exodus ix. 32 is doubtful, spelt being perhaps intended. It is much cultivated in the north of Europe and in some parts of Asia. Its cultivation does not extend so far n. as that of barley; but it grows in regions too cold for wheat, and on soils too poor and sandy for any other grain. Its ripening can also be more confidently reckoned upon in cold regions than that of any other grain. But rye succeeds best and is most productive in a climate where wheat still ripens. It delights in sandy soils. The varieties of rye are numerous, although much less so than those of other important cereals. Some are best fitted for sowing in autumn, others for sowing in spring. The former kinds (*winter rye*) are most extensively cultivated, being generally the most productive. In some places on the continent of Europe rye is sown at mid-summer, mowed for green fodder in autumn, and left to shoot in spring, which it does at the same time with autumn-sown rye, producing a good crop of small but very mealy grain. In Britain rye is not a common grain crop, and is cultivated to a smaller extent than it formerly was; the sandy soils to which it is best adapted being improved and fitted for other kinds of corn. It is, however, sometimes sown to be used as a green crop for feeding sheep and oxen in winter, and is found particularly good for milk cows. It is sometimes also mown for horses and other animals.—Bread made of rye is much used in the north of Europe. It is of a dark color, more laxative than that made of wheat flour, and perhaps rather less nutritious. Rye is much used for fermentation and distillation, particularly for the making of *Hollands*. Rye affected with ergot (q.v.) is a very dangerous article of food. The straw of rye is tougher than that of any other corn-plant, and is much valued for straw-plait.—**PERENNIAL RYE** (*S. perenne*) differs from common rye in having a very hard, red-like culm; ears 3 to 5 in. long, flatly compressed, with a brittle rachis, and 50 to 60 closely imbricated spikelets. It endures for many years, but is not much cultivated, as its grain is slender and does not yield an easily separable flour.

RYE, a t. in Westchester co., N. Y., on Long Island sound; pop. of township, 5,936. The village is on the New York and New Haven railroad, 2 m. s.w. of Port Chester, and 24 m. n.e. of New York. Rye Beach, in the same township, is a favorite summer resort. In the town are many handsome residences of business men of New York. It contains three churches and an excellent institution for the education of young ladies. In this town is the thriving village of Port Chester, on Byram river, the boundary between New York and Connecticut.

RYE, a sea-port, market-t., and parliamentary and municipal borough in the s.e. of the co. of Sussex, 10 m. n.e. of Hastings. It is charmingly situated on an eminence bounded e. by the Rother, and s. and w. by the Tillingham, which streams unite here, and entering the sea 2 m. below the town form the old harbor. The appearance of the town is remarkably quaint and old-fashioned. Overlooking the junction of the streams is a small castle built by William de Ypres in the reign of Stephen, and now used as a jail. The church is a beautiful and interesting structure—the central tower, transepts, a number of circular arches, etc., all being early Norman. In former times the sea flowed close up to Rye, washing the rock on which the Ypres tower stands, but it has retired to a distance of 2 miles. The harbor admits vessels of 200 tons, and has been recently improved. This ancient town receives historical mention as early as 893. It was walled on two sides by Edward III., and contributed nine ships to the fleet with which that monarch invaded France. Brewing, ship-building, and trade in corn, hops, etc., are carried on. Rye is one of the cinque-ports, and sends a member to parliament. Pop. '71: of municipal borough, 3,865; of parliamentary borough, 8,290.

RYE-GRASS, *Lolium*, a genus of grasses, having a two-rowed, flatly-compressed spike, the spikelets appressed edgewise to the rachis. **COMMON RYE-GRASS**, or **PERENNIAL RYE-GRASS** (*L. perenne*), the *ray-grass* of the older English authors, is frequent on waysides, and in meadows and pastures, in Britain and on the continent of Europe. The spikelets are much longer than their solitary external glume, 6 to 8 flowered; the florets awnless or nearly so; the culm flattened, from 1 ft. to 3 ft. high; the root producing leafy barren shoots, which add much to the agricultural value of the grass. This grass is highly valued for forage and hay, and is more extensively sown for these uses than any other grass, not only in Britain, but on the continent of Europe and in North America. It grows well even on very poor soils. The *common perennial rye-grass* is the kind most generally cultivated. A kind called *annual rye-grass*—not really an annual plant, although useful only for one year—is sometimes cultivated; but is in almost every respect inferior.—**ITALIAN RYE-GRASS** (*L. italicum*, or *L. multiflorum*, or *L. Bouchianum*), a native of the south of Europe, is much esteemed as a forage and hay grass. In many soils and situations in Britain it succeeds extremely well, and is remarkable for its verdure and luxuriance in early spring. It is preferred by cattle to the common rye-grass. The young leaves are folded up, whilst those of the common rye-grass are rolled together.—There are many varieties of rye-grass. It is nowhere so much valued or cultivated as in Britain. It was cultivated in England before the end of the 17th century. Italian rye-grass was introduced into Britain in 1831 by Mr. Thomson of Banchory, and Messrs. Lawson & Son of Edinburgh. Rye-grass is generally sown along with some kind of corn, and vegetating for the first year among the corn, appears in the second year as the proper crop of the field.

RYEHOUSE PLOT. In 1683, at the same time that a scheme was formed in England among the leading whigs to raise the nation in arms against Charles II., a subordinate scheme was planned by a few fiercer spirits of the party, including col. Rumsey and lieut.col. Walcot, two military adventurers; Goodenough, under-sheriff of London; Ferguson, an independent minister; and several attorneys, merchants, and tradesmen of London—the object of which was to waylay and assassinate the king on his return from Newmarket. The deed was to be perpetrated at a farm belonging to Rumboldt, one of the conspirators, called the Ryehouse farm, whence the plot got its name. The Ryehouse plot is supposed to have been kept concealed from Mommouth, Russell, Shaftesbury, and the rest of those who took the lead in the greater conspiracy. It owed its defeat to the circumstance that the house which the king occupied at Newmarket took fire accidentally, and Charles was thus obliged to leave that place eight days sooner than was expected. Both the greater and lesser conspiracy were discovered before long, and from the connection subsisting between the two it was difficult altogether to discover them. The indignation excited by the Ryehouse plot was extended to the whole whig party; lord Russell, Algernon Sidney, and lieut.col. Walcot were brought to the block for treason; John Hampden, grandson of his more noted namesake, was fined £40,000; and scarcely one escaped who had been concerned in either plot.

RYERSON, ADOLPHUS EGERTON, D.D., LL.D., b. Charlotteville, Upper Canada, 1803; was a teacher; and in 1825 entered the Wesleyan ministry; established in 1829 and for some years edited the *Christian Guardian*; was a delegate to the British conference in 1832–36, and 1840; appointed in 1841 principal of Victoria college, Coburg, C. W.; chief superintendent of education for Upper Canada in 1844. In 1849, after visiting the United States and studying the public school system, he submitted a plan for organizing the common school system in Canada, which was adopted. He published a history of Canada and of the *British United Empire Loyalists of America*.

RYLAND, JOHN, 1753-1825; b. England; was so precocious that he read the Psalms in Hebrew at 5 years of age, and the Greek Testament through before he was 9; preached at the age of 17 to the Baptist church at Northampton; assisted his father in his school; 1770-75; became pastor of the Northampton church in 1776. In 1792 he aided in the organization of the Baptist missionary society at Kittering; became pastor of the Broadmead chapel and president of the Baptist college at Bristol in 1793, both of which positions he held for 33 years. In 1815 he became secretary of the Baptist missionary society.

RYMER, THOMAS, 1638-1713; b. England; educated at Cambridge, and called to the bar. He succeeded Shadwell as historiographer to William III. in 1692. He wrote a *Short View of Tragedy*, 1693, in which he attacks Shakspeare. In 1694 appeared his translation of Rapin's *Reflections on Aristotle's Treatise of Poesie*. His only valuable work is the *Fœdera*, a collection of all the treaties of English with foreign sovereigns. It appeared in 17 volumes about 1700.

RYOT (from the Arabic *raaya*, to pasture, to protect, to govern; hence, literally, the governed, a subject) is the vernacular term for a Hindu cultivator or peasant.

RYOTWAR (literally, according to or with ryots) is the term applied to the revenue settlement which is made by the government officers in India with each actual cultivator of the soil for a given term—usually a twelvemonth—at a stipulated money-rent, without the intervention of a third party. This mode of assessment prevails chiefly, though not exclusively, in the Madras presidency. See H. H. Wilson, *Glossary of Judicial and Revenue Terms* (Lond. 1855), under RĀIYATWĀR.

RYSBRACH, MICHAEL, a sculptor of considerable talent, b. at Antwerp in 1693. He settled in London in 1720, and executed numerous works there, in particular the monuments to sir Isaac Newton in Westminster abbey, and to the duke of Marlborough at Blenheim, a bronze equestrian statue of William III. for the city of Bristol, a colossal statue of George II. for the parade at Greenwich hospital; a Hercules, and busts of many of the eminent poets, wits, and politicians of his time. Scheemakers, also a native of Antwerp, and Roubilliac, a Frenchman, were contemporaries and rivals of his, and shared with him most of the commissions for works of sculpture in England at the period. With Scheemakers was placed as a pupil Nollekens, who became so distinguished for his busts, and as one of the founders of the English school of sculpture. Rysbrach died Jan. 8, 1770.

RYSINGH, JOHN CLAUDE, was secretary of the chamber of commerce at Stockholm, and in 1654 was sent out as vice-governor of the Swedish colony on the Delaware. He surprised and took possession of the Dutch fort Casimir, but the Dutch in 1655 attacked New Sweden, and put an end to Swedish power in that region.

RYSWICK, PEACE OF, a treaty concluded in 1697 at Ryswick, a Dutch village between Delft and the Hague, which was signed by France, England, and Spain on Sept. 20, and by Germany on Oct. 30. It put an end to the sanguinary contest in which England had been engaged with France. It has been often said that the only equivalent then received by England for all the treasure she had transmitted to the continent, and all the blood which had been shed there, was an acknowledgment of William's title by the king of France; but it must not be forgot how much the allies were benefited by the check given to the gigantic power and overweening ambition of France.

S

S, THE nineteenth letter in the English and other western alphabets (the eighteenth in the Latin), belongs to the dental series, and marks the fundamental sound of the hissing or sibilant group, *s, z, sh, zh*. The Sanskrit has characters for three hissing or *s*-sounds; the Shemitic languages had four (see ALPHABET). The Hebrew or Phenician character, from which the modern *s* is derived, was called *shin*—i.e., tooth, and in its original form probably represented two or three teeth. The same character, with the presence or absence of a diacritic point, marked either *s* or *sh*. In England, *s* is used both for the sharp and flat sounds, as *this, those = those*. The nearness of the *s*-sound to *th* is seen in the English *loves = loveth*, and in the phenomenon of hisping—*yeth = yes*. This seems to furnish the transition to the so frequent interchange of the High-Ger. *s* for the Low-Ger. *t*, as in Ger. *wasser = water*; Ger. *fuss = foot*. Comp. Gr. *thalassa = thalatta*. The substitution of *r* for *s* is noticed under R. In such cases as *melt*, compared with *smelt*; *pike*, with *spike*; *lick*, with *sleek*; Ger. *niesen*, with Eng. *sneeze*; Eng. *snow*, Goth. *snaires*, with Lat. *nix* (gen. *niv-is*); Gr. *mikros*, with *smikros*; *short*, A.-S. *secoort*, with *curt*—it is difficult to say whether the form with, or that without the *s* is the older. Grimm considers *s* as the remnant of an old prefixed particle (*as, is, us*), having, perhaps, the force of *ex* in Lat. *exopto*, I wish greatly; or *ur* in Ger. *urklein*, very small. An initial *s* before a vowel in Lat. corresponds to Gr. *h*; comp. Lat. *sub, sez, sal* (salt), with Gr. *hypo, hex, hals*. In Greek and Latin, *s* was pronounced feebly at the end of words, and still more so between two vowels. It thus fre

quently disappeared in these positions, and this was one of the chief sources of the irregularities in the declensions and conjugations, which had originally been formed on a uniform system: (see INFLECTIONS.) The dropping of *s* is one of the ways in which the forms of modern French words have become so degraded; compare Lat. *magister*, old Fr. *maistre*, modern Fr. *maître*; *presbyter*, *prestre*, *prêtre*. Even where still written, final *s* in French is mostly silent—e.g., *vos*, *les*.

SAAD-ED-DIN, a Turkish historian, was b. in 1536, and died at Constantinople in 1599. His history, entitled the *Taj-al-Tuvarikh* (the crown of histories), a work held in high estimation by scholars, gives a general account of the Ottoman empire from its commencement in 1299 till 1520; it has never been printed, but MS. copies of it are found in most of the great libraries of Europe, and an inaccurate translation into Italian was published in 1646-52. Saad-ed-din also wrote the *Selim-Nameh*, or history of Selim I., which is chiefly a collection of anecdotes regarding that prince.

SAA'DI, SHEIK MOSLIIH ED-DIN. See **SADI**, *ante*.

SAADIA BEN JOSEPH, 892-942; b. Fayûm, Egypt; was a distinguished Jewish philosopher and poet; an instructor in the school of Sura in Babylonia in 928. He wrote in Hebrew and Arabic; published poems on the history and laws of the Jews, a translation of the Pentateuch into Arabic and a treatise on *Religious and Doctrines*, which was translated into Hebrew under the title of *Emunoth Vedeboth*.

SAA'LE, a river of Germany, distinguished from other and smaller rivers of the same name as the Saxon or Thuringian Saale, rises on the western slope of the Fichtelgebirge (Bavaria), and flowing northward through several minor states, and finally across the Prussian province of Saxony, falls into the Elbe, about 25 m. above Magdeburg, after a course of 200 miles. It is navigable only within the Prussian dominions.

SAAR BRÜCKEN, a t. of Rhenish Prussia, on the Saar, 40 m. s.s.e. of Treves. It is the seat of an active industry, of which coal-mining, spinning, and the manufacture of woolen and linen fabrics, and of pottery and tobacco, are among the principal branches. Pop. '75, 9,047. It was at Saarbrücken that the French and German armies first met in the war of 1870-71.

SAAR DAM. See **ZAANDAM**.

SAARLOUIS, a t. of Rhenish Prussia, 31 m. s.s.e. from Treves, and between four and five m. from the frontier of France. It stands on the left bank of the Saar, a branch of the Moselle, and is a place of some strength, being walled, and containing several forts. It is of considerable importance as a border fortress. There are manufactures of fire-arms in the town, and lead and iron mines in the neighborhood. There are also wire-works. Saarlouis was long in the possession of France, and was fortified by Vauban in the reign of Louis XIV. The congress of Vienna gave it to Prussia in 1815. Pop. '75, 6,897.

SAAZ, a t. of Bohemia, on the Eger, 45 m. w.n.w. of Prague. Hops are largely cultivated in the vicinity, and important corn-markets are held. Pop. 8,870.

SABADELL', a rising manufacturing t. of Spain, in Catalonia, 14 m. by railway n.w. of Barcelona. It has risen into importance only within recent years, and it is now the Manchester of Catalonia. Woolen and cotton fabrics are the staple manufactures, and of the 100 factories in the town, by far the greater number are engaged in these manufactures. Pop. about 16,000.

SABADILLA, CEBADILLA, or CEVADILLA. *Asagraea officinalis*, formerly *Helonias officinalis*, a Mexican plant of the natural order *melanthaceae*, the seeds of which are employed in medicine, because of properties analogous to those of white hellebore (*veratrum album*). The plant has a bulbous root, and grows in tufts; the leaves are linear and grassy, about four ft. long, and not above a quarter of an inch broad; among them rises a round *scape* (leafless flower-stem), about six ft. high, bearing a very dense raceme, a foot and a half long, of small white flowers. The seed-vessels are papery *follicles*, three together; the seeds one, two, or three in each follicle, two or three lines long, winged, and wrinkled. The powdered seeds have been known in medicine since the end of the 16th century. On submitting them to chemical analysis, they are found to consist of fatty matter, two special organic acids, to which the names *cevadilic* and *veratric* acids have been given; of varieties of resin, yellow coloring matter, gum, and a highly poisonous alkaloid named *veratria* in combination with gallic acid; and to these constituents a French chemist, Couerbe, has added a crystalline body named *sabadilline*.

Notwithstanding its highly poisonous properties, Sabadilla is prescribed on many parts of the continent as a vermifuge in cases of tape-worm and ascarides, and it may be administered to an adult in 8 or 10 grain doses, mixed with a little sugar, and a few drops of oil of fennel. In the form of powder, it is sometimes applied to the head to destroy lice, but if the skin be broken, some other remedy should be selected, as absorption to a dangerous extent might ensue. From its stimulating properties, it is usefully employed in the form of tincture (which, however, is not an official preparation) as an external application in chronic rheumatism and paralysis, and in cases of nervous palpitation.

The active principle of Sabadilla, the *veratria*, in doses of $\frac{1}{4}$ of a grain, gradually

increased, and taken thrice a day, has been found very efficacious in acute rheumatism; and applied in the form of ointment, it has been highly recommended in scrofulous diseases of the joints. When prescribed internally, its use should be at once suspended if the patient complain of pain in the throat or stomach, vomiting or diarrhea.—Similar qualities are said to exist in the seeds of *veratrum sabadilla*, a native of Mexico and the West Indies, and in some of the species of *helonias*, natives of the southern parts of North America.

SABÆANS, the supposed descendants of one, two, or three Shebas mentioned in the Bible. Historically, the Sabæans appear chiefly as the inhabitants of Arabia Felix or Yemen (to the n. of the present Yemen), the principal city of which was called Saba, and the queen of which is said to have visited Solomon, attracted by the fame of his wisdom. Josephus, however (*Ant.* viii. 6, 5), makes her the queen of Ethiopia (Meröe), and the modern Abyssinians claim her as their own. Her name, according to their tradition, was Makeda; and her visit to Jerusalem made her not only a proselyte to the religion of Solomon, but she became one of his wives, and had by him a son, Menilek, who afterward ruled Ethiopia (q. v.). The Arabs, on the other hand, called her Balkis, the earliest name that occurs of a Himyaritic queen; but there is no more historical value to be attached to this tradition than to the innumerable legends that have clustered round her name in connection with the great king.

Numerous passages in Greek and Roman writers, as well as in the Bible, testify to the vast importance of these dwellers in Yemen as a wealthy, widely-extended, and enterprising people, of fine stature and noble bearing. Their chief greatness lay in their traffic, the principal articles of which consisted of gold and perfumes, spice, incense and precious stones, a very small portion of which, however, was of home production, Yemen being only productive in corn, wine, and the like matters of ordinary consumption. But the fact was, that the Sabæans held the key to India, and were the intermediate factors between Egypt and Syria, which again spread the imported wares over Europe; and even when Ptolemy Philadelphus (274 B. C.) had established an Indian emporium in Egypt, the Sabæans still remained the sole monopolists of the Indian trade, being the only navigators who braved the perilous voyage. As in many other respects, they also resembled the Phœnicians in this, that, instead of informing other people of their sources and the tracks of their ships, they told them the most preposterous tales about the countries they visited, and the fearful dangers they encountered; and in regard to most things, endeavored to impress upon the minds of their customers that what they sold them was, if artificial, their own manufacture—if natural products, home growth. Being the principal merchants of those things which the over-refined luxury of late classical times considered as absolute necessities of life, they could not fail to gather enormous riches; e. g., in the 3d c. of the Roman empire, every pound of silk—a material enormous quantities of which were used—that came from Arabia was paid by a pound of silver, at times even of gold. As a natural consequence, the Sabæans became luxurious, effeminate, and idle. The pictures of them drawn by the classic writers are doubtless exaggerated. The country itself, according to the reports of Greek writers, grew spice-wood to such an extent that its odor caused apoplexy among the inhabitants, and bad smells had to be used to counteract these over-potent influences. The meanest utensils in the houses of these merchant princes were—if we were to credit those writers—wrought in the most cunning fashion, and were of gold and silver; their vases were incrustated with gems, their firewood was cinnamon. Their colonies must, in the nature of things, have extended over immense tracts of Asia—the Ethiopian Sabæans probably being one of the first foreign settlements; yet nothing beyond the vaguest conjectures can be given about them. Regarding their government, Dio Cassius informs us that they had a king, who never was allowed to leave his palace, and that the first child born, after the accession of a new king, into one of a certain number of noble families, was considered the heir-presumptive for the time being. Commerce had also done for them what it did for the Phœnicians—it civilized them, and caused them to carry civilization further; and they stand out among the ancient semi-barbarous Arabs as a commonwealth of high culture. Respecting their religion, see ZABISM. Their language is supposed to have been a Semitic (Arabic) dialect, which, however, is almost entirely lost to us now. Some tablets with Himyaritic inscriptions have been found, but their readings are not quite satisfactorily fixed as yet. See SEMITIC LANGUAGES, ARABIA.

SABBATH (Heb. *shabbath*, *sabbathon*, etc., from *shabath*, to rest; not from *shub*, to return, or *shebah*, seven) designates the seventh day of the week, set aside, in the Old Testament, as a period of cessation from work. Without entering into the question of its origin, i. e., whether it be an institution of pre-Mosaic times—either of “paradise” or of “heathenism”—or whether it be purely Mosaic, we shall merely state that, according to our only available source, the Pentateuch, the division of the week (q. v.) into seven days appears at a very early period; but the celebration of the seventh day as a day consecrated to Jehovah is first mentioned after the Exodus from Egypt, and seems to have preceded the Sinaitic legislation, which merely confirmed and invested it with the highest authority. On the occasion of the manna (Ex. xvi. 23), the Sabbath and its solemnity seem presupposed, and the “Remember the Sabbath-day” of the Decalogue further seems to indicate its previous institution. There is no trace of its celebration in the

patriarchal times, although the Semitic traditions of the creation, and of the divine completion of it on that day, had undoubtedly marked it early as a special day of sanctity among the Abrahamites. The significance that was super-added to it after the Exodus, i. e., that of being a remembrance of the freedom from bondage, makes it appear likely enough that its first legal promulgation dates, as a Talmudical tradition has it, from Marah, where Moses "set them laws and rights" (Ex. xv. 25). While it thus on the one hand formed a sort of general human memento of the creation and the Creator of all things, as it is characterized in the first redaction of the commandments in Exodus, it became also, on the other hand, a national day of record of the bondage and the liberation from it, a notion prominently brought forward in the second recension of the Decalogue (q. v.) (Dent. v. 15), and the "rest" that was inculcated for everybody—kindred, strangers, slaves, even animals—received a double meaning. It is in the latter sense also denominated a sign between Jehovah and the generations of Israel (Ex. xxxi. 13): a kind of badge of nationality, a token of the covenant between Jehovah and Israel forever (Ex. xxxi. 16, cf. Ezek. xx. 12, Neh. ix. 13, etc.). It is constantly mentioned together with institutions of the same peculiar nature; such as reverencing the sanctuary (Lev. xix. 30), celebrating the feasts of a national character (Hos. ii. 11), keeping the ordinances (Ezek. xlv. 17), etc. And in like manner it was made one of the first obligations for proselytes, as one by which they were "taking hold of the covenant" (Is. lvi. 6). A few special cases only are furnished by the Pentateuch in explanation of the word "work" used in the prohibition—lighting a fire, gathering sticks, going out of the camp for the purpose of gathering manna. The violation of this law of rest was, as a crime of high treason against Jehovah, punishable with death; yet cessation from labor was only the negative part of the celebration of the day, which is called, like the other festivals, a "holy convocation." It is difficult to decide now what precise meaning is to be attached to these words, as referring to the early periods of Israelitish history, particularly before the institution of the prophets or sacred orators had been fully developed. It may be conjectured that the convocation was a kind of general religious assembly, in which readings and some kind of exposition of the law formed the principal features; and there is indeed a tradition to that effect recorded in the Talmud. Some, however, suppose that it was a festive meeting in honor of Jehovah, and refer to Neh. viii. 9-18 for proof that such a celebration was consistent with Jewish notions of keeping days holy to the Lord. As a further celebration of the day, a special burnt-offering consisting of two lambs of the first year, with the corresponding meat and drink offering, besides the ordinary daily sacrifice, was instituted, and the shew-bread was renewed in the sanctuary.

Thus far the Pentateuch on the Sabbath. Turning to the later biblical books of the times before the exile, we find casual references to it as a day of rest and joy, exalted over the other days of the week, and on which agricultural labors and all things connected with them, such as carrying loads, selling and buying, etc., ceased. No deeper signification seems to have been attached to it yet. Although both Jeremiah and Ezekiel single it out especially, in common with monotheism and the laws of morality, yet they both rest satisfied with the inculcation of its outward observance, which seems occasionally to have fallen into entire disuse. With the return from the exile, however, a new phase was inaugurated. It is well known how energetically Nehemiah carried out his reformation, or rather the restoration of the primitive laws, as in other respects so with regard to the Sabbath; how he "testified" against those who were treading wine-presses on the Sabbath, and bringing in sheaves, and lading asses, etc., and further, against those "men of Tyre" who brought "all manner of ware, and sold on the Sabbath unto the children of Judah and in Jerusalem." It is by profaning the Sabbath, he urges, that their fathers have caused all the evil and wrath that befell the nation and the city. He had the gates shut from Friday evening to Saturday night, and drove away those merchants who still kept lodging outside, by threats of "laying hands on them."

What Nehemiah had reinstated seems to have been most rigorously upheld, and in many cases made more binding even than he ever intended it, or, at all events, than the originally promulgated form of his words would seem to imply at first sight. With respect to the Sabbath in particular, we find it not more than 100 years afterward kept with such severity that the people would not even stir in defense of the city of Jerusalem, stormed by the soldiers of Ptolemy I. on that day. Later still, those who had fled into caves to escape the persecution of Antiochus Epiphanes allowed themselves to be butchered wholesale, nay, burned alive, without any attempt at flight or resistance; "because they made a conscience to help themselves for the honor of the most sacred day" (2 Macc. vi. 11). It was only in consequence of these horrible catastrophes, and in consideration of the probability of the enemy's always choosing the hallowed day for his attacks, and thus gradually rooting out the nation, that fighting in self-defense was allowed; although it appears the enemy was not to be disturbed in his siege works. Yet this relaxation in favor of the defensive appears again to have been abrogated through the influence of the fanatical Chassidaic party. Both Pompey and Herod, it would seem, took advantage of the Sabbath for the preparation of the storm on Jerusalem, relying—and successfully—on the strict observance of that day by their antagonists. The incessant tribulations, however, that followed almost without interruption till the final destruction of the Jewish empire, together with the influence of new schools and

views, wrought an immense change. Shammai himself, the austere interpreter of the law, and the so-called antagonist of the milder Hillel, pronounced not only the defensive but the offensive legal and righteous (Sabb. xix. a): as, indeed, in his days, human life was placed, under all circumstances whatsoever, higher than any divine or human precept about the Sabbath. "The law," it is said with regard to the Sabbath, was given, according to the Scriptures, like other laws, "that man should *live by them*," not that he should die through them" (Tos. Shab. xvi. 5). That Joshua had never stopped in his sieges on the Sabbath was not considered so weighty an argument as the dire and imminent necessity that forced itself upon the military and spiritual leaders of the people, of preserving at all hazards a remnant at least of the fast perishing nation.

It was probably after the exile that the first attempts at legally fixing, or rather "fencing about," the divine ordinance in a minute and rigorous manner, were made. As we have seen before, no special definition of the "work" prohibited—save in a few instances—is to be found in the Old Testament. Whether it was the "men of the great synagogue," or the later schools, that promulgated the special precepts and prohibitions—part of which were traced to the legislation on Sinai itself (oral law)—is difficult to decide. The Mishna only enumerates thirty-nine principal ("father-") works, each of which, again, carries a certain number of minor ("begotten") works with it, which are strictly forbidden on the Sabbath. A certain portion of these inhibitions and prohibitions refers to work connected with agriculture and the chase; another to domestic labors generally performed by women (such as spinning, sewing, etc.); another again to trades (of builders, mechanics, laborers, etc.) and the like. One of the most harassing of precepts, and one which had at last to be amended by a number of new enactments, was the prohibition of moving things from one place into another (from public to private localities, and *vice versa*). The minor prohibitions referred chiefly to things which might easily "lead" to the violation of the Sabbath, such as riding on horseback, climbing trees, etc. The "Sabbath-day's journey," or prohibition, based on Ex. xvi. 29, of walking more than the supposed utmost space between the ark and the extreme end of the camp, seems to belong, in the Mishnaic form at least, to the Roman times; the *mil* to which it was limited, and which contains the requisite 2,000 yards, being a Roman measure.

However it is to be reconciled with the well-known narrative of Christ's healing on the Sabbath-day, contained in the New Testament, there is absolutely no doubt about the fact that, according to the so-called Pharisaical code—i. e., the oral law, the highest and absolute authority of Judaism—the safety of life and limb utterly overrules not only the Sabbath, but even the day of Atonement itself. It is only certain smaller alleviations of momentary pain, such as could not by any chance place the patient in the slightest danger, about which we find some kind of casuistical discussions. Practically—that is, according to the final enactment (see Maimonides *Yad Chasaka*)—it is not only the regard to life, but to the health and well-being of the patient, that sets all Sabbatical prohibitions at naught. The law of "rest," according to the Talmud, applies no more to the case of the sick or those anyhow endangered, than it did with regard to the temple, and all the "work" therein, which, indeed, was much heavier on Sabbath and feast days than at other times. Another difficulty is found in the words in which Christ refers to the beast that is to be taken out of a pit on a Sabbath; the Jewish law ordaining, in reality, that it should be aided in its own efforts, if it endeavored to get out by itself; if it did not succeed, it should be left there, food being let down to it, until the end of the Sabbath (Luke xiv.; Matt. xii. 11; Sabb. 128 b). Could it be that the common people (the Hediots or Idiots—i. e., the untutored in the law) were ignorant of the real scope and purport of the "Pharisaical" code, and that the argument was directed against their crude notions, as directly opposed to the law as established?—But on this we must not enlarge here. It is also impossible to enter into any of the various ancient and modern ways of looking at the Sabbath in an allegorical and symbolical light, e. g., its being connected by Philo and his school with the planets, the spheres, the number seven, and the like mystical notions. Nor can we follow here those speculations which make out a close parallel between the divine work and rest and human work and rest; and show how well-rounded and entire time itself appears when shaped into a week after the model of the six days of creation, and how man's life is, through it, conformed to that of his Creator.

There can be no doubt about its meaning in the Old Testament. It is intended as a principal testimony of faith in the Creator of the universe. Hence its supreme importance. Though the threatened punishments for Sabbath-breakers never seem to have been carried out to the full during the times of the established commonwealth, in the scheme of Judaism it was placed on a par with the entire body of the law. He who transgresses the Sabbath is considered legally, according to Maimonides, as one who has set the whole law at defiance, and is to be looked upon in every respect as like a "worshiper of stars"—i. e., a heathen.

Regarding the development of the positive side of the Sabbatical observance, we have to mention first, that in conformity with the precept making it a day of "holy assembly," the synagogue (irrespective of the temple-service, its special sacrifices, prayers, and psalms for the day), assembled the faithful on that day within its precincts in every town and hamlet in and out of Palestine before and after the final exile. A

certain portion of the Pentateuch, to which afterward was added a prophetic pericope, the Haftarah, was read, translated into the vernacular, and expounded homiletically. Special prayers and psalms, in addition to the ordinary slightly-modified service, with special reference to the sanctity of the Sabbath, were said and sung, and the rest of the day was devoted to pious meditation, study in the law, and to serenity and joyfulness. Respecting this last point, it must be in mind that the day is distinctly called a *day of joy and delight* (e.g., cf. Ps. xcii., Is. lviii. 13, Hos. ii. 11, 13, etc.—the words in Is. translated in the authorized version by “by doing thy pleasure.” in reality mean “doing thy work;” the Hebrew word in this passage exactly corresponding to our “affairs,” “business”). A variety of minor regulations referring to bodily indulgences on that day, abundantly prove—if further proof were needed—its recognized character as a “feast-day” in the natural and general sense of the term, in Judaism. It was to be honored by the wearing of finer garments, by three special meals of the best cheer the house could afford (fish, meat, etc.); and it was considered a particularly meritorious thing on the part of the master of the house to busy himself personally as much as possible with the furnishing of the viands, nay, the fetching of the very wood for the cooking, so as to do as much honor to the “bride Sabbath” as in him lay. Wine, if the means of the individual would anyhow allow it, was to crown the repast, special blessings being duly pronounced over it with reference to the holy day, both at its coming in and at its going out. From the circle of the family, this custom of welcoming, as it were, the Sabbath, and taking leave of it, with the cup of blessing, with lights, and with spice, found its way at an early period into the synagogue, on account of those strangers who, having to stop on their journey during the twenty-four hours, were often lodged and fed in or near the synagogue, and on whose behalf the blessing had to be pronounced generally. Fasting, mourning, mortification of all and every kind, even special supplicatory prayers, are strictly prohibited; but, on the contrary, the number of “a hundred benedictions,” said at all varieties of enjoyments of the senses, are to be completed on the Sabbath, were it even by eating different kinds of fruit, smelling different spices, etc. Those who study hard during the week are to relax somewhat on that day, while those bent on business all week may indulge more freely in their readings; even school children are to be released from hard lessons on that day. Nay, the Friday itself participated in a manner in the solemnity of the Sabbath. Its very name was sunk in “eve of Sabbath.” At an early hour in the afternoon trumpets were blown from the steps of the temple in Jerusalem; and certain shops, the stopping of whose business required some time, began to close. Again and again the trumpets resounded at certain intervals, and other trades ceased, as, indeed, nothing might even be begun on Friday which could not be finished or stopped at the end of that day: walking also was restricted to a certain extent on Friday, and judgment over life and death was entirely suspended. At last, when the sun disappeared from the horizon—irrespective of the situation of the place, whence a difference arose between the beginning of the Sabbath among the dwellers in valleys or on elevations—the hallowed period commenced, and lasted until three stars were visible in the following evening.

The original formulas, much enlarged in later times, as far as they are to be traced now, of the introductory benediction, as well as the valedictory prayer, both of which we subjoin, show the character and scope of the day in Judaism so fully, that they may stand instead of any further explanation of our own.

1. (Kiddush.) “Blessed art thou, O Lord, our God, king of the universe, who hath sanctified us by his laws, and hath made us participate in his grace, and hath, in his love and in his mercy, given us the Sabbath, as a remembrance of the creation, as the first day of holy convocations, and in memory of the redemption from Egypt; for thou hast chosen us and sanctified us from all peoples, and hast given unto us thy holy Sabbath in love and in grace. Blessed art thou, O Lord, who sanctifieth the Sabbath.”

2. (Habdalah.) “Blessed art thou, O Lord, our God, king of the universe, who divided between holy and unholy, between light and darkness, between Israel and the peoples, between the Sabbath and the six days of creation. Blessed art thou, O Lord, who divideth between holy and unholy.”

The same character of cheerfulness, of happy rest from the toil and turmoil of the world's business; of quiet and peaceful “return into one's self;” of joyous communion with friends and kindred over good cheer—in short, of mental and bodily relaxation and recreation that strengthens, braces, pacifies, and maketh the heart glad, while the sublime ideas which it symbolizes are recalled to the memory at every step and turn—seems to have prevailed at all times, down to our own, among the Jews. Whatever difference there may be in the peculiar customs respecting the Sabbath among some of the recent sects among them, e.g., the Karaites, the Chassidim, etc. (see JEWISH SECTS), they chiefly refer to the liturgy (with the one vital exception that the Karaites entirely abstain from the use of light and fire during the whole of the twenty-four hours), and to some minor points, upon which we cannot dwell here. It is also unnecessary here to go into the special “superior” or “mourning” Sabbaths during the year, i.e., those that precede or follow certain festivals or days of humiliation, or such as formerly inaugurated new academic semesters (Kallah), and the like. Suffice it to reiterate that in every class, every age, and every variety of Jews, from first to last, the Sabbath has been absolutely a day of joy and happiness, nay, of dancing, of singing, of eating and drinking, and of luxury.

The "luxus Sabbatarius" of Sidonius Apollinarius has indeed been a reproach to them, as was their supposed over-indulgence in laziness. The thinking minds were, according to Philo and others, more than ever busy on that day with those sacred mysteries of God's revelation to man and his miraculous workings on behalf of the "chosen" nation; others' hearts were lifted up by prayers, by readings, by earnest exhortations, and by pleasing and instructive homiletics. A dark, fanatical, self-torturing spirit is as foreign to the Jewish Sabbath (which is prolonged as far as possible) as it is foreign to the Mosaic and post-Mosaic legislation, its written and oral laws in general.

The benefits of the institution itself for the individual are, after what we have said of its practice, too self-evident to require further comment. How it connected, on the one hand, the human being with the divine Creator, and, on the other, with his fellow-creatures, brother and stranger, children and slaves, nay, the very beast of burden, the ox and the ass—how, ever recurring, it inculcated with irresistible force pious reverence, fear, and love of God, the sole master of all things—man's time and property included—good-will to all things created, and the absolute equality of all men—need not be urged here. Proudhon has recently treated on it from the national-economy point of view, and he has come to the conclusion that the proportion of the six days of work to the one of judicious rest is one of manifest wisdom, and of great blessing to man.

It is necessary here to say a few words with reference to the notion that the Sabbath, i. e., the celebration of the seventh day as a day of rest, is an institution common to all or most of the civilized nations of antiquity (Assyrians, Arabs, Egyptians, Greeks, Romans), from whom Moses has also been charged with having borrowed it. There is no more truth in these statements than there is in the often repeated assertion of an ancient Sabbath among the aboriginal savages. The dicta of Philo and Josephus, to the effect that there was no city, either Hellenic or barbarian, and not a single people, to which the custom of the Sabbath had not penetrated, have absurdly enough been taken by some as a proof that the Jews borrowed the custom. If the number seven [six and one] is one to which a peculiar significance attached at a very early period, in connection with the calendar (compare the seven worlds, the seven continents, the seven seas, etc., of the Indian cosmogony), and if the weekly cycle of seven days which goes back to the ante-Mosaic period (see Gen. xxix. 27, *seq.*; vii. 4, 10; viii. 10, 12, etc.), is, probably, the common property of the Semitic races; yet there is a mighty difference between counting time by seven (the ancient Egyptians had, in fact, a ten days' previous to a seven days' cycle), and making the seventh day a "day of rest and holy convocation," with reference to the national life of Israel. There is no special sanctity found attached to the day either with the Egyptians or with the pre-Mohammedan Arabs, who sacrificed on that day in black garments, in a hexagonal black temple, an old bull to Saturn: exactly as they sacrificed a boy on another day of the week, sacred to the planet Jupiter. As for the Greeks, the only authenticated passage we find with reference to the subject, is Hesiod's (*Op. et D.* 770, etc.) reference to the seventh day of the month, sacred to Apollo as other days were sacred to other gods. Other verses quoted by Clemens Alexandrinus and Eusebius, as from Homer and Hesiod, are proved to be spurious Judæo-Hellenic fabrications. The Roman calendar knows absolutely nothing of a hallowed seventh day.

Thus much on the Sabbath under the "old dispensation." We have still to consider it in relation to the Christian church, and to trace the progress of opinion and practice in regard to the observance of the first day of the week, which in this country is frequently styled the Sabbath, or, more definitely, the Christian Sabbath.

It is hardly necessary to observe, that all the discourses of Jesus were addressed to Jewish hearers, subject, like himself to the Mosaic law. That he is nowhere recorded to have enjoined the observance of the Sabbath has by some been thought significant, but seems to have been natural enough in a case where those he addressed, so far from neglecting the duty, were superstitiously scrupulous in its performance. What his hearers needed and received was the lesson that, the Sabbath having been intended for human benefit, the duty of observing it ought to give way before the higher duty of effecting that purpose, when the two were in conflict; and that trivial acts demanding no exertion were not to be confounded with that real and exhausting labor which was the thing truly forbidden. (Matt. xii. 1-14; Mark ii. 23-28; iii. 1-6; Luke vi. 6-11; cf. Hosea vi. 6; Psal. l. 8-14; li. 16, 17; Is. i. 10-17; Jer. vi. 19, 20; vii. 21-23; 1 Sam. xxi. 6.) Some have thought that by making clay on a Sabbath to anoint the eyes of a blind man, and by ordering an invalid, when cured, to carry home his bed on another Sabbath, he designed to intimate, if not the present abolition of the Sabbath, at least its approaching end. But others look upon the former of these acts as much too trivial to be confounded with "servile work," and the latter as an exceptional case within the scope of the principle above stated. On no occasion does he appear to have sanctioned the performance of real work on the seventh day, unless it was demanded by some higher duty than that of bodily rest.

For several years after the death of Jesus the church included none but Jews, and by these the Sabbath and other Mosaic rites continued to be observed as before. It was not till Peter's visit to the centurian Cornelius (41 A.D.) that the gospel began to be preached to the Gentiles; and when the apostles and elders met at Jerusalem to consider what was to be done with the Gentile brethren, it was decided that no Mosaic burden

should be laid upon them beyond abstinence from certain practices, of which working on the Sabbath is not one (Acts xv. 23-29). Nevertheless, the Judaizing party continued in various places to demand more or less conformity to the law on the part of the Gentile converts. This party was strenuously withstood by Paul (q. v.), in whose epistles the dispute is a subject that frequently recurs. From his letters to the churches of Rome, Galatia, and Colosse, which contained both Jews and Gentiles, we learn that, while the Jews wished the Gentiles to observe the Sabbaths prescribed in the law, the Gentiles were prone to treat the observance of Jewish ceremonies with contempt. Upon both parties the apostle enjoins mutual forbearance and respect; forbidding the Jew, who esteemed one day above another, to disturb the Gentile, who esteemed every day alike, and ordering the Gentile to refrain from contemning the observances conscientiously performed by his weaker brother the Jew (Rom. xiv.; Col. ii. 11-17). That he never taught the Jewish Christians to abandon the observance of the law, but, on the contrary, continued to the end to observe it himself—as appears from Acts xxv. 8, xxviii. 17; Philip, iii. 6—are facts of which different explanations have been given by theologians; some thinking that the law continued binding on the Jews, whether Christians or not, so long as the temple stood; while most are of opinion that conformity to the rooted notions and habits of that people was tolerated for a time, in order that the diffusion of the gospel might not be impeded among them. In the eastern churches, where the proportion of Jews was greater than in the west, the Sabbath continued to be observed till the 5th c., when we lose sight of the Ebionites (q. v.) a sect of Judaizers such as Paul withstood—and of the more moderate Ebionitic Nazarenes, who, though they conceived it to be their *own* duty to circumscribe, keep the Sabbath, etc., had no desire to impose the peculiarities of Judaism on the Gentile Christians. Down to the present time, however, Sabbath-keeping and various other Jewish rites continue to be practiced along with Christian observances by the Christians of Abyssinia, whose ancestors, it is probable, derived them, either (as a tradition among them indicates) from missionaries of the Alexandrian church, of which many members were Jews, or from expatriated Hebrews who settled in Abyssinia at some much earlier date. In other countries, also, many of the Gentile Christians seem to have anciently observed the Sabbath, if not by resting the whole day from work, at least by attending on it the religious meetings of their sabbatizing Jewish brethren.

Hitherto we have spoken of the observance of *Saturday*, the day of rest prescribed to the Jews, and to which exclusively the name of the Sabbath day was anciently applied, and still continues to be given by every nation but our own and its offshoots. At what date the Sunday or first day of the week began to be generally used by Christians as a stated time for religious meetings, we have no definite information either in the New Testament or in the writings of the fathers of the church (q. v.). By none of the fathers before the 4th c. is it identified with the Sabbath, nor is the duty of observing it grounded by them either on the fourth commandment, or on the precept or example of Jesus or his apostles, or on an ante-Mosaic Sabbath law promulgated to mankind at the creation and continuing in force after the coming of Christ. To the reality of such a law—which many modern Christians have deduced from Gen. ii. 2, 3; iv. 3; vii. 4, 10; viii. 4, 10-12; xxix. 27; i. 10; Ex. xvi. 4-30, and which some (as bishop Horsley, Serm. 22) regard as an indispensable basis for a Christian Sabbath—it has been objected that the attention of the Gentile converts, who must be supposed to have been ignorant of the law in question, is nowhere found in Scripture to have been directed to it by Paul; that his declarations of their freedom from the observance of days are so general as to apply to every law on that subject, whensoever enacted; that consequently he must either have been unacquainted with a primeval law, or (if not) have regarded it as obsolete under the new dispensation; and lastly, that the fathers, had they known such a law, would have mentioned it in their writings, instead of vindicating (as Justin, for instance, does in his *Dialogue with Trypho the Jew*) the neglect of Sabbath-keeping by Gentile Christians, on the ground that the Sabbath began with Moses and was not observed by the patriarchs. By none of the fathers is any Sabbath-law whatever represented as being in force among the Gentiles.

On what grounds, then, did the Christians observe the first day of the week as a time for religious assemblies?—and how and when did the custom of so distinguishing it begin? To these questions very different answers have been given. According to some theologians apostolic precept or example is the only conceivable origin of a custom apparently so general as well as early; and of such *example*, at least, they find evidence in John xx. 19, 26; Acts ii. 1; xx. 6, 7; 1 Cor. xvi. 1, 2; and Rev. i. 10. But others, doubting or denying the conclusiveness of this scriptural proof, conceive that an adequate explanation may be found in the circumstances of the primitive church. That the desire which naturally actuates the members of every new and unpopular religious sect to meet frequently for worship, instruction, and mutual encouragement might very soon lead to the fixing of stated days for that purpose, may be assumed as self-evident; that a weekly day should be chosen would be a natural result of the Jewish habits of the earliest Christians; and that the day on which their Lord had risen victorious from the grave should be thought fittest for this weekly festival is precisely what was to be expected in their circumstances. But the resurrection of Jesus is by no means the only reason assigned by the fathers for the honor which they paid to the Sunday. By Justin

(see JUSTINUS), in whose *Apology for the Christians to Antoninus Pius*, ss. 87-89, written between 138 and 150 A.D., the earliest undoubted mention of Sunday meetings in the works of the fathers occurs, several reasons for holding them *then* are assigned—the first being that on this day of the week the world and light were created; and the second being the resurrection of Christ. “We, all of us,” says he, “assemble together on Sunday, because it is the first day in which God changed darkness and matter, and made the world. On the same day, also, Jesus Christ our Saviour rose from the dead; for he was crucified on the day before that of Saturn; and on the day after that of Saturn, which is that of the sun, he appeared to his apostles and disciples, and taught them what we now submit to your consideration.” To these reasons, Origen (*Seventh Hom. on Exod.*) adds the fact that manna was first given to the Israelites on a Sunday; while subsequent writers adduce various other events, either recorded, or by them imagined to have occurred on that day. In arguing with Trypho, Justin opposes Sabbath-keeping by Christians, on grounds which would have been retorted by the Jew as condemning equally the observance of a first-day Sabbath, had the Sunday at that time been regarded as the Sabbath: from which fact and the circumstance that in his *Apology* already spoken of, where he professes to give the emperor Antoninus a full account of the observance of the day, no mention is made of rest from labor as a part of that observance, the inference has been drawn that, except during the time of divine service, the Christians in this father’s age thought it lawful to follow, and actually did follow, their worldly pursuits on the Sunday. It is true that by Tertullian, who wrote in the latter half of the 2d c., the Christians are described as “putting off even their business on the Lord’s day, lest they might give place to the devil” (*De Orat.* c. 23); an indication, in Neander’s opinion (*Church Hist.* i. 409, Bohn’s ed.), that now the Jewish law of the Sabbath had begun to be applied to the Lord’s day. But the soundness of this interpretation has been questioned—Dr. Hessey, for instance (*Bampton Lectures*, 1860, p. 63), stating that he can find in it “nothing Sabbatarian—nothing, in fact, more than I should have expected, considering that the church had now become somewhat settled—that, rather than that the duties peculiar to the Lord’s day should be neglected, worldly business was put off to another day.” But whatever may have been the opinion and practice of these early Christians in regard to cessation from labor on the Sunday, unquestionably the first law, either ecclesiastical or civil, by which the sabbatical observance of that day is known to have been ordained, is the edict of Constantine, 321 A.D., of which the following is a translation: “Let all judges, inhabitants of the cities, and artificers rest on the venerable Sunday. But in the country husbandmen may freely and lawfully apply to the business of agriculture; since it often happens that the sowing of corn and planting of vines cannot be so advantageously performed on any other day; lest, by neglecting the opportunity, they should lose the benefits which the divine bounty bestows on us” (*Cod.* iii. 12, 3). Before this time, such of the Christian writers as had endeavored, by a mystical style of interpretation, to turn the Mosaic ceremonies to account as sources of moral and religious instruction, had, probably in imitation of Philo (q. v.) (*Works*, iii. 265, Bohn’s ed.), spiritualized the law of the Sabbath to the effect of representing it as a mystical prohibition to the Christian of evil works during all the days of his life, and a prefiguration of the spiritual repose and enjoyment which is his portion both in this world and in the next. But in addition to this significance, there now began to be discovered in the Old Testament, foreshadowings of the new Sunday-Sabbath; and Eusebius (q. v.), bishop of Cæsarea, the friend and biographer of Constantine, was able to descry in Ps. xlii. 5, and lix. 16, prophetic allusions to the *morning* assemblies of Christians on Sundays for worship, and in Psal. xxii. 29, a prefiguration of the weekly celebration of *the Lord’s supper* on that day. Applying Ps. xcii. to the first day of the week, the same writer says that “the word, by the new covenant, translated and transferred the feast of the Sabbath to the morning light, and gave us the symbol of true rest—viz., the saving Lord’s day, the first of the light,” etc. From other passages in Eusebius and subsequent writers, it is plain that they meant, not that this transference had been formally ordained by Christ (of which there is no trace in Scripture), but that by rising from the tomb on the first day of the week he had made that day more illustrious than the Sabbath, and more worthy to be celebrated by the holding of Christian assemblies for worship than the Sabbath was to be similarly honored by the Jews. About the end of the 4th c. Chrysostom is found similarly expounding Gen. ii. 3, which, in his opinion, shows that already from the beginning God offered us instruction typically, teaching us to dedicate and separate the one day in the circle of the week wholly to employment in things spiritual—thus (as his translator observes) making the Sabbath a *type* of the Lord’s day, and rest *from* bodily, of rest *in* spiritual work. (*Library of the Fathers*, ix. 209.)

It was a natural result of Constantine’s law, backed by such interpretations of the Old Testament as these, that in the words of Dr. Hessey, “a new era in the history of the Lord’s day now commenced; tendencies toward sabbatarianism or confusion of the Christian with the Jewish institution beginning to manifest themselves. These, however, were slight until the end of the 5th c., and are traceable chiefly to and in the civil legislation of the period. Afterward they developed themselves more decidedly; sabbatarianism became at length systematized, in one of its phases, in the ante-reformation church both in England and on the continent by the later schoolmen, probably in their desire to

lay down exact rules for consciences, and under a fancied necessity of urging the precedent of Jewish enactments in support of Christian holy-days" (p. 20). But it was not till the year 538 that abstinence from agricultural labor on Sunday was recommended, rather than enjoined, by an ecclesiastical authority (the third council of Orleans), and this expressly "that the people might have more leisure to go to church and say their prayers;" nor was it till about the end of the 9th c. that the emperor Leo, "the philosopher," repeated the exemption which it enjoyed under the edict of Constantine (Leo, *Const.* 54). And now the Lord's Day being thoroughly established by law as a Sabbath, the fourth commandment would more than ever be employed by the clergy as a means of persuading to its observance. The entire decalogue, indeed, has long been used by them as a convenient summary of human duty; and by the later schoolmen it came to be represented as, to a certain extent—i.e., so far as it coincided with the law of nature—actually *obligatory* on Christians. This theory of its binding force and the notion of the holiness of days were vigorously opposed by Luther and the other reformers, who denounced also the excessive multiplication of festivals, and proclaimed that the pardon of sin was not to be secured by their observance, or otherwise than by faith in Christ. (See Luther's *Larger Catechism*; the *Augsburg Confession*, 1530, c. vii.; Calvin's *Institutes*, b. ii. ch. viii. ss. 28-34; and his other writings on the subject, collected by R. Cox in *The Whole Doctrine of Calvin about the Sabbath and the Lord's Day*, Edin. 1860.) But while condemning everything which they viewed as abuses and corruptions, the reformers never ceased to acknowledge the manifold utility and high importance of the Sunday as a day of rest, worship, and decorous enjoyment. Like the later fathers and the schoolmen also, they recognized in the fourth commandment a useful means of instruction and exhortation; but, as we have said, they utterly rejected it as a law. "The ten commandments," says Luther, "do not apply to us Gentiles and Christians, but only to the Jews." (*On the Ten Commandments*). "A law," says Grotius, "obliges only those to whom it is given; and to whom the Mosaic law is given, itself declares: 'Hear, O Israel.'" (*De Jure Belli et Pacis*, lib. i. c. i. s. 16). He quotes also Deut. iv. 7, and Ps. cxlvii. 19, 20. This is not antinomianism (q. v.); the reformers acknowledged their subjection not only to the more perfect law of Christ, but to that universal and perpetual law which Paul (Rom. ii. 14) speaks of as the light to the Gentiles of old, who, "not having the law, were a law unto themselves, showing the work of the law written in their hearts." See *ETIMES*.

The distinction, however, between Moses as a lawgiver and Moses as a teacher, was one very apt to be overlooked by the multitude and disregarded in popular discourses by the clergy themselves. In England where the writings of the reformers were less studied than in Germany, the response after the fourth commandment in the liturgy (where the decalogue, adapted to general use by the omission of the words addressing it to the Jews, was inserted in 1552), "Lord, have mercy upon us, and incline our hearts to keep *this law*," must have greatly tended to instil the belief that this commandment imposed on them the duty of keeping, not a mystical, but a literal Sabbath. Accordingly, in the reign of Elizabeth it occurred to many conscientious and independent thinkers (as it had previously done to some Protestants in Bohemia), that the fourth commandment required of them the observance, not of the first, but of the specified *seventh* day of the week, and a strict bodily rest as a service then due to God; while others, though convinced that the day had been altered by divine authority, took up the same opinion as to the Scriptural obligation to refrain from work. The former class became numerous enough to make a considerable figure for more than a century in England under the title of "sabbatarians"—a word now exchanged for the less ambiguous appellation of "seventh-day Baptists." The other and much larger class were the Puritans (q. v.), who, justly offended by the vices and frivolity of the times, but also soured by persecution, applying to themselves the threats of Jehovah against the profaners of the token of the covenant between him and his chosen people—led astray by the mistranslation of Is. lviii. 13 above noticed—overlooking the incidents in Luke xiv. 1-12—and giving a narrower scope than the reformers had done to the teaching of Paul—added to Sunday-keeping an austerity by which neither it nor the Sabbath-keeping of the Jews had ever before been marked. (See *ASCETICISM*.) This great party, when predominant for a time in the reign of Charles I., availed themselves of the opportunity to maintain and spread their sabbatarian opinions, not only in numerous treatises, but through what has proved to be the more lasting and influential means of the *Westminster Confession* and *Catechisms*. (See *ASSEMBLY OF DIVINES; CATECHISMS; CREEDS AND CONFESSIONS*.) Chiefly through these formularies was effectually introduced into Scotland that scrupulous abstinence from recreation as well as business on Sunday which still distinguishes the people. For it is a mistake to suppose that either sabbatarianism or asceticism was recommended by Knox. Agreeing with the other reformers, Knox, in setting forth in his *Confession of Faith* (1560) "the works of the first table," says not a word about the Sabbath. This *Confession* and the *Geneva Catechism* were adhered to in Scotland till superseded in 1648 by the Westminster standards of faith. Nor is it only to the British Presbyterians that the opinions and habits of the Puritans have descended; as the colonists of New England they planted in that distant soil the rigid sabbatarianism which still survives in Massachusetts and Connecticut, and retains the Jewish peculiarity (which found its chief advocates in Prynne and Shepard, 1655) of being observed from sunset to sunset. In

America, too, exists now the principal remnant of the seventh-day Baptists. (See Rupp's *Relig. Denom. in the United States*, pp. 70-111; Mrs. Davis's *History of the Sabbatarian Churches*, Philad. 1851; and the publications of the American (seventh-day) Sabbath tract society, New York, 1852, etc.) They have nearly disappeared in England, though in the 17th c. so numerous and active as to have called forth replies from bishop White Warren, Baxter, Bunyan, Wallis, and others.

In Holland, though some English Puritan settlers gave birth to a controversy which, during the greater part of the 17th c. engaged the pens of many of the most eminent divines (among whom were Gomarus, Walaens, Rivetus, Cocceius, and F. Burmann), the principles of the reformers, favored by Grotius among the laity, ultimately kept their ground, as they have done also in Protestant Germany. Yet in Holland were produced the two bulkiest defenses of Sabbatarianism that have ever been published—one, in Latin, by John Brown, an expatriated Scotchman who had been minister of Wamphray, entitled *Causa Dei contra Anti-Sabbatarios* (2 vols., Rotter. 1674-76); and the other, in Dutch, by his friend James Koelman, on *The Controversy, History, and Manner of Observance of the Sabbath and the Lord's Day* (Amst. 1685).

In England the earliest considerable treatise on the Puritan side was the *Sabbatum Veteris et Novi Testamenti* of Dr. Nicholas Bound, a minister in Suffolk (Lond. 1595; 2d ed. 1606). It is written in English, though the title is partly Latin. Many converts were made by it and the similar works of Greenham and Widley, his contemporaries; but till the heterodoxy of the Seventh-day Baptist Brabourne aroused, in 1632, the indignation of the bishops, little noise seems to have been made throughout the nation by the controversy; nor would it, perhaps, have ever attained prominence, had not Charles I. committed, in 1633, the blunder, and, as the Puritans believed, the gross impiety, of reviving his father's *Declaration concerning Lawful Sports to be used [on Sundays]*. (See SPORTS, BOOK OF.) This the clergy were required by Laud (q.v.) to publish in their churches, and many who refused were punished severely. Hence arose the greatest English controversy about the Sabbath, between the high-church party on the one hand, and the Puritans on the other. Bishop White (*Treatise of the Sabbath Day*, 1635) and Dr. Heylin (q.v.) (*History of the Sabbath*, 1636) took the lead for the former, and were ably supported by Sanderson (*A Sovereign Antidote against Sabbatarian Errors*, 1636), Ironsides (*Seven Questions of the Sabbath briefly Disputed*, 1637), Taylor (*Holy Living*, ch. iv. s. 6, and *Ductor Dubitantium*, b. ii. ch. ii. rule 6, ss. 43-62), and Bramhall (*On the Controversies about the Sabbath and the Lord's Day*, in his Works, fol. p. 907). On the Puritan side were Henry Burton (*The Lord's Day the Sabbath Day*, 1636), John Ley (*Sunday a Sabbath*, 1641), Hamon L'Estrange (*God's Sabbath before the Law, under the Law, and under the Gospel*, 1641), Richard Bernard (*A Threefold Treatise of the Sabbath*, 1641), William Twisse, prolocutor of the Westminster assembly (*Of the Morality of the Fourth Commandment, as still in force to bind Christians*, 1641), and jointly Cawdrey and Palmer, two members of the same assembly, in their *Sabbatum Redivivum, or the Christian Sabbath Vindicated* (2 vols. 1645-52), which is the most elaborate defense of Sabbatarianism in our language. A still more eminent writer on that side, and one of greater breadth of view, was Dr. John Owen, whose *Exercitations concerning a Day of Sacred Rest* (1671), since prefixed to his *Exposition of Hebrews*, gave, however, some offense to his friends by suggesting that the duration of the religious exercises of the day should be measured by the strength of the worshiper. Since then, the Sabbatarian cause has been maintained by numberless writers, among whom may be mentioned bishop Hopkins, Willison, Jonathan Edwards; Dwight, Stopford, Macfarlan, and others to be afterward named; while the opposite side is supported by Baxter, Milton, Barrow, Barclay, Morer, Michaelis, Paley, Evanson, Higgins, etc.

In the first half of the reign of George III., the comparative neglect into which the observance of the Lord's day had fallen in England aroused the anxiety of its friends, and many efforts were made to bring the people to a better disposition toward it. Paley did excellent service, especially by his chapter on the use of Sabbatical institutions (*Moral Philosophy*, b. v. ch. vi.); while bishop Porteus successfully exerted himself to check open indulgence in vicious and unseemly amusements. About the same time the new "evangelical" (q.v.) party began those efforts which it makes for the promotion of a strict observance of Sunday according to the Puritan model. But what, perhaps, had most effect in turning the current of public opinion in that direction was the substitution of the decade (see DECA) for the week, and the abolition of public worship, by the national convention of France in 1793 (see CALENDAR); proceedings which brought to the aid of the pious advocates of the Lord's day the political conservatism and anti-Gallican feelings of the British people. In the next generation, the revival of the study of ancient Christian literature led to fresh advocacy of the Lutheran views concerning the Sabbath and the Lord's day, by bishop Kaye (*On Justin Martyr*, 1829), Dr. Whately (*Thoughts on the Sabbath*, 1830), Mr. Bannerman (*The Modern Sabbath Examined*, 1832), and the Oxford "Tractarians;" while Sabbatarianism had influential advocates in bishop Mant (*The Christian Sabbath, its Institution and Obligation*, 1850), Dr. Daniel Wilson, afterward bishop of Calcutta (*The Divine Authority and Perpetual Obligation of the Lord's Day, Asserted*, 1830), and Dr. Ralph Wardlaw (*Discourses on the Sabbath*, 1832)—in support of whose principles was founded in 1831 the London "society for promoting the due observance of the Lord's day," which, aided by similar associations in Scotland and

the United States, still keeps a jealous watch on behalf of the institution. For 17 years preceding his death in 1849, its most noted member, sir Andrew Agnew, M.P. for Wig-tow-shire, sought indefatigably both in and out of the house of commons for a stricter legal enforcement of rest on Sunday; and though he failed to get his bill passed, the agitation which he headed was not wholly fruitless. The attempts, however, which he and his friends have made to suppress all post-office action on Sunday, all stated conveyance of passengers on railways, and such recreations as walking in public gardens, listening to music in the London parks, and viewing works of nature and art in the national collections, have seemed, even to many friends of the institution, to display more zeal than wisdom or knowledge, and have led to the formation (in 1855) of "the national Sunday league"—a society which, while deprecating the conversion of any part of the day into a season for ordinary labor, or for frivolous or vicious amusement, conceives that a more cheerful mode of spending some of its hours is expedient, and that the opening of public gardens, museums, and galleries of art, would promote alike the health and the moral and intellectual elevation of the people.

In France, where the week was restored by Napoleon I. in 1806, the Sunday has not yet wholly recovered its former status as a day of rest; but efforts have lately been made by both clergymen and laymen to convince the people of the advantage of suspending all but necessary labor upon it. Among the advocates of this reform are Pérennès, Gaume, and Mullois, who, however, discountenance the austerity of the Puritans. In Switzerland, Mellet, the pastor of Yvorne, is the author of a clever treatise on *Sunday and the Sabbath*, of which there is an English translation (Lond. 1856). Bred a Sabbatarian, he was converted to the Dominical view by reading Dwight's *Sabbatarian Discourse on the Perpetuity of the Sabbath*, a doctrine still upheld by the "evangelical" party in Switzerland.

Of late years the bearing of geological discovery on the interpretation of the Hebrew narrative of the creation, and consequently on the Sabbath controversy, and, in particular, on questions arising out of the discrepancy between the two copies of the fourth commandment, has been largely discussed. See GENESIS; DECALOGUE. Into the merits of this and other disputed points it is impossible to enter here; but, in concluding the present historical sketch, it may be allowable to express the satisfaction with which we observe that, notwithstanding the wide diversity of opinion as to the authority of the Lord's day and the manner in which it may and ought to be spent, almost all agree in esteeming it highly as a civil institution at least, and in wishing to defend it from the intrusion of business as far as the public good will allow.—For additional information and discussion, see (on the Sabbatarian side) Holden's *Christian Sabbath* (Lond. 1825); *Report from the Select Committee of the House of Commons on the Obs. of the Sabbath-day* (sir A. Agnew's committee), Aug. 6, 1832; Jordan's *Scriptural Views of the Sabbath of God* (Lond. 1848); M'Crie's *Memoirs of Sir A. Agnew* (Edin. 1850); Pirret's *Ethics of the Sabbath* (Edin. 1855); Fairbairn's *Typology of Scripture* (3d ed. Edin. 1857); J. Gillillan's *Sabbath Viewed in the Light of Reason, Revelation, and History, with Sketches of its Literature* (Edin. 1861); and (on the Dominical side) Arnold's *Sermon's*, vol. iii. (Lond. 1844), and his *Life* by Stanley, 5th ed. vol. i. p. 364, and vol. ii. p. 206; Neale's *Feasts and Fasts* (Lond. 1845); sir W. Domville's *Examination of the Six Treats commonly adduced from the New Testament in Proof of a Christian Sabbath* (Lond. 1849); Hengstenberg on *The Lord's Day*, translated by J. Martin (Lond. 1853); F. D. Maurice's *Sermons on the Sabbath-day* (Lond. 1853); R. Cox's *Sabbath Laws and Duties* (Edin. 1853); Domville's *Inquiry into the supposed Obligation of the Sabbaths of the Old Testament* (Lond. 1855); *Sunday the Rest from Labor*, by a Christian (Lond. 1856); Dr. W. F. Hook on *The Lord's Day* (Lond. 1856); *Time and Faith* (Lond. 1856); Alford's *Greek Testament with Commentary* (Lond. 1856-61); F. W. Robertson's *Sermons*, 1st and 2d series (Lond. 1856); Baden Powell's *Christianity without Judaism* (Lond. 1857); Reichel's *Lord's Day not the Sabbath* (Dubl. 1859); W. Logan Fisher's *Hist. of the Institution of the Sabbath-day, its Uses and Abuses*, 2d ed. (Phila. 1859); Dr. J. A. Hessey's *Sunday; its Origin, History, and present Obligation*, being the Bampton lectures for 1860; and the *Edin. Review* for Oct., 1861, p. 535. Of the British Seventh-day Baptists the principal works are those of Brabourne (1632), F. Bampfield (1677), Cornthwaite (1740), and Burnside (1825). The Roman Catholic doctrine respecting the Lord's day is amply stated in *The Catechism of the Council of Trent* (1567), Part III., pp. 351-357, 391-403 of the English transl. (Lond. 1852). As to all shades of opinion, see R. Cox's *Literature of the Sabbath Question* (2 vols. Edin. 1865). Proudhon's work, above referred to, is entitled *De la Célébration du Dimanche Considérée sous les Rapports de l'Hygiène Publique, de la Morale, des Relations de Famille et de Cité* (Paris, 1850).

SABBATHAIS ZWI, one of the most remarkable "messiahs" of modern times, the founder of a wide-spread sect of semi-Christians and semi-Jews throughout Europe, Asia, and Africa, was b. at Smyrna in 1641. A boy of extraordinary gifts, he had at the age of 15 already mastered the Talmud, and at 18 was an adept in the mysteries of the Cabbala. Very soon, incited by fantastic dreams and more fantastic friends, he declared himself to be the Messiah, who had been sent to shake off the thralldom both of Christianity and Mohammedanism from the Jews, and to convert all humanity. The supreme rabbinical council thereupon excommunicated him. He, however, continued

to preach his "mission" as before. He was now declared an outlaw, and his death was decreed, yet nobody dared to touch him. At last his expulsion from Smyrna was resolved upon by the municipal authorities. Four apostles—one of them a reconverted Jew, who had previously turned Christian—followed him on his way to Saloniki, where he arrived in 1659, having gathered a vast number of disciples, mostly wealthy, on his road. His extraordinary personal beauty and his fiery eloquence soon brought the most influential Jewish inhabitants on his side, and his cabalistic formulas and prayers were adopted into the ritual of their synagogue. Two years later, however, he had to leave Saloniki, where powerful antagonists had risen in the mean time, and went first to Palestine and soon after to Alexandria, accompanied by several thousand disciples. Here his power and influence grew so rapidly that the revenues of the commonwealth to be founded by the new messiah, and the ways and means of supporting the wars he was going to wage, were seriously taken into consideration. In 1664 no fewer than about 80,000 people belonged to the new empire; and in the following year the beginning of the messianic reign within a few months, and the rebuilding of the temple in the next year, were proclaimed aloud in the streets of Alexandria by Sabbathais and six disciples, all clad in white raiments, with garlands on their heads. Somewhat later he returned to Jerusalem; and the resurrection, to take place within six years, and the deposition of the sultan, whose crown would be placed upon Sabbathais's head, were proclaimed far and near. Upon this all the Jews of Asia, Africa, and Europe were divided into two camps. Those who believed, finding all the predicted signs fulfilled now, sold everything they had in order to get ready money for their journey to and final abode in the new capital, Jerusalem; others, and among them some of the highest spiritual authorities, declared all the pretended messiah's miracles to be cabalistic tricks, and himself an impostor. Returned to his native place, Smyrna, he was received with full royal honors. Meanwhile the attention of the divan was drawn to this movement, and Mohammed IV., then in Adrianople, ordered the grand vizier to secure the person of Sabbathais, and to commit him to prison, until the investigations set on foot should be concluded. Two agas, however, returned with their janizaries, without having effected the order, not having dared "to stretch forth their hand against the sacred man." He now offered to surrender voluntarily. He was committed as prisoner of state to Kuthajah, where he received visits and deputations from all parts. Being at last brought before the sultan, his courage failed him, and he declared himself to be nothing more than a simple rabbi: it was only his disciples, he averred, who had called him a messiah. The sultan then proposed to test his "mission." Three poisoned arrows were to be shot at him. Did these prove harmless, he, the sultan, would at once range himself under his flag. In speechless terror, Sabbathais, at the instigation of his Jewish interpreter, now took the turban from the head of some official, and placed it upon his own, thereby indicating, as the interpreter declared, that his sole object had been all along to embrace Islam, and to carry over all the Jews with him. The sultan declared himself satisfied, and honored him with the title of an effendi, giving him an honorary post at the same time.

But, extraordinarily enough, the movement was far from having reached its end. The most wonderful stories were circulated among the believers. A fictitious man was supposed by some to have embraced Islam, while the real Messiah had ascended heavenward. Others believed that Islam was to form part of the new religion; and Sabbathais, countenancing this view, converted many Jews to Mohammedanism. Nathan, one of his most enthusiastic disciples, traveled about, and caused strife without end, even sanguinary revolts. Many, however, had turned from him by this time, and the voices of the rabbis and their excommunications began to tell more forcibly. Finally, the grand vizier was persuaded to imprison Sabbathais once more, and to send him to Bosnia, where he died in a prison in Belgrade—according to some, in consequence of poison, while according to others he was executed in 1677, ten years after his conversion. It is very difficult to judge correctly of a character like his. Even his worst enemies never had a word to say either against his morality or against the extraordinarily brilliant powers of his mind, and his erudition. Probably, he was a self-deceiver, whose plans were not measured by the means in his hands for their execution. His death, however, was only the signal for the re-enforcement of his sect, which even many of his former antagonists now joined, and which now, for the first time, was developed into a proper religious system—that of the Sabbathites or Sabbathians (Shebsen), the chief apostles being Nebemiah, previously a bitter enemy of Sabbathais (1677-90), and Nebemiah Hajun (1708-17). The latter taught the dogma of the Trinity as part of the new faith; and it became a principle of this religion to accept and to modify itself to the dominant creed of the country—Islam in the east, Christianity in the west. Remnants of it are still in existence in Poland and Turkey. See JEWISH SECTS.

SABBA TIA, a genus of plants, of the natural order *gentianaceae*, natives of North America. They are small herbaceous plants, some with simple, and some with branched stems. They all contain, like many others of the same order, a pure bitter principle, on account of which they are useful in intermittent fevers and as a tonic. They are much employed in the United States.

SABBATICAL YEAR (Heb. *Shenath, Shabathom, Shebith, Shemittah*; Gr. *Hebdomatikos* or *Sabbatikos entantos*). There are four special injunctions found respecting the celebration of it in the Pentateuch. The first (Exod. xxiii. 10, *seq.*) ordains that the land, after being sown, and its fruits reaped for six years, should be left to itself in the seventh, so that the poor, and the beasts of the field should eat its spontaneous growth. The same is to be the case with the vine and olive-yards. The second (Lev. xxv. 2-7) views the hallowed period as a "Sabbath of rest unto the land"—as a solemnity in honor of Jehovah. It is there further enjoined that the growth of the seventh year be "meat" both for proprietor, servants, and strangers; that, in fact, it should be common property. A somewhat new significance, but strictly analogous to the first-named ordinance, is given to the institution in the third passage (Deut. xv. 1-11), in which the creditor is enjoined to release the debts owing to him by his poor brother and neighbor. It has been matter of much dispute whether this "release" implies the entire giving up of the debt, or a mere respite. The Mishna decides in favor of the former; and such were the effects of the law, carried out in accordance with this view, that it was found necessary utterly to paralyze it by an act called the *prosolul* (Gr. *proshoulé*), passed by Hillel the great. The fourth passage (Deut. xxxi. 10-13) contains the command to read in the solemnity of the year of release in the "feast of tabernacles," the law before all the people in holy convocation, men, women, children, and strangers. We need only remark here that the fundamental idea of the sabbatical year is identical with that of the weekly Sabbath itself; see also JUBILEE, the highest exaltation, as it were, of the idea of sabbatical rest. As to the practical working of the institution, we learn that it gave rise repeatedly to famine (1 Macc. vi. 49, 53; Jos. *Ant.* xiv. 16, 2, etc.), and that it was altogether so fraught with practical difficulties, that from the time it is supposed to have been inaugurated—viz., fourteen years after the Israelites' first entry into Palestine (seven years' conquest, and seven years' division of the land), it never seems to have been kept before the exile. It has erroneously been supposed by some that the slaves were set free in the sabbatical year. The passage in question refers only to the seventh year of the individual slave's service. Like the jubilee, it was proclaimed on the tenth day of the seventh month, at the end of the harvest-time. Reasonable doubts have been expressed regarding the "possibility" of the jubilee (q.v.) ever having been kept in reality; yet there is no doubt about the rigor with which the sabbatical year was kept up, after the exile, to a very late period. Alexander, Cæsar, and the late emperors exempted the Jews from tribute during it. The sabbatical year being one of the "ordinances attached to the land"—i. e., Palestine only—it ceased with the final overthrow of the Jewish commonwealth.

SABBIONETTA or **SABBIONETA**, a city of northern Italy, province of Cremona, with 2,000 inhabitants. It is situated in a marshy district, which affords abundant fodder and pasturage. It was the capital of a principality given by Napoleon I. to his sister Pauline in 1806, and was a place of some consequence; now it is a decayed city, the population of which is daily decreasing.

SABELLIUS, a celebrated African heresiarch of the 3d c., was b. probably at Ptolemais in the Pentapolis, where, at all events, his opinions were first promulgated. Nothing is known regarding his life—the few statements current on the subject being of a contradictory and untrustworthy character, and it is generally thought that he did not broach his heresy till shortly before his death—the date of which is also unknown. Sabellius is pronounced by Neander "the most original and profound thinker among the Monarchians"—i. e., the Unitarians; but unfortunately only a few fragmentary notices of his teaching have been preserved, and these by his theological adversaries. It would appear that he did not reject the scriptural phraseology used in speaking of the Godhead. "Father," "Son," and "Holy Ghost" were sacred and venerable names to him as well as to orthodox Christians; but he was strongly opposed to the ecclesiastical conception of this Trinity, as a trinity of distinct persons, or subsistences (*hypostases*), which he (like many other persons since) held to be absurd and unthinkable, and argued that what is to be understood is a Trinity of manifestation. The single absolute Divine essence—the *monas* or "pure Deity," unfolds itself in creation and the history of man as a Trinity. His words, as quoted by Athanasius, are: *He monas platantheisa gegone trias*. The "energy" by which God called into being and sustains the universe is the "Logos," after whose image men were created; but when they had fallen from perfection, it became necessary for the "Logos," or divine energy, to hypostatize itself in a human body, in order to raise and redeem them; hence in the man Christ Jesus dwelt the fullness of the Godhead *bodily*; while the same divine energy, operating spiritually and impersonally in the hearts of believers, is the "Holy Ghost." This is not, perhaps, so very heretical after all. But, on the other hand, we must not overlook the fact that Sabellius held these Divine "manifestations" to be merely temporary, and that after the "Logos" and the "Holy Ghost" had done their work, they would be reabsorbed in the absolute Deity—the *trias* would again resolve itself into the *monas*; or, in the language of St. Paul, that "God would be all in all." Epiphanius alleges that Sabellius derived his system from an apocryphal "gospel to the Egyptians;" and there are (as Neander points out) so many points of resemblance in Sabellianism to both the Alexandrian Jewish theology in general, and the particular gospel referred to, that the statement may be regarded as at least indicating

the direction from which proceeded the influences that determined the theosophy of the unknown Pentapollitan. The followers of Sabellius were formally suppressed by the Catholic church in the 4th c.; but his doctrine, which, divested of its Gnostic and Neoplatonic phraseology about "emanation" and "reabsorption," etc., is substantially Unitarian, has seldom wanted eminent advocates in any subsequent age of Christianity. —Consult Tillemont's *Memoirs*; Lardner's *Credibility of the Gospel*; and the Church Histories of Moshcim, Neander, and Milman.

SABER, a heavy sword, with which dragoons are armed. The back is thick, that a blow may carry the more force, and also to render the weapon useful in the rough thrust of a cavalry charge. A saber is occasionally curved at the point, in the form of a cimeter.

SABER-TACHE (Ger. *säbeltasche*, sword-pocket), a useless square accouterment which dangles against the legs of officers in some cavalry regiments. It purports to be a pocket for the conveyance of dispatches, etc., but probably is never used. The saber-tache is hung by smaller ornamental belts from the sword-belt, and is itself covered with gold brocade, the emblems of the regiment, and other devices.

SABIANS. See **SABEANS**, *ante*.

SABICU, *Acacia formosa* (see **ACACIA**), a tree, the wood of which is remarkably hard and tough. It is a native of Cuba. The wood is of a dull red color, and close short grain. The wood was used to construct the stairs of the crystal palace in Hyde park in 1851, and "after six months' use the steps hardly exhibited any signs of wear."

SABIN, **JOSEPH**, b. England, 1831; became a bookseller, afterward a publisher and bibliographer. In 1848 he came to the United States, where he is considered a high authority in all relating to his specialty. He has compiled catalogues of many private libraries, and was editor and part owner of the *American Biblioplist*.

SABINE, a river of the United States, rises in the n.e. part of Texas, and flows s.e. 250 m. to the eastern boundary of Texas, whence flowing southerly, it forms the eastern boundary, and empties itself through Sabine bay, 18 m. long by 9 m. wide, into the gulf of Mexico. The Sabine is 500 m. long, but shallow and unnavigable.

SABINE, a parish in w. Louisiana; drained by the Sabine river and San Miguel bayou; about 972 sq.m.; pop. '80, 7,344—1858 colored. The surface is level and well wooded. The soil is good. The principal productions are corn and cotton. Co. seat, Manny.

SABINE, a co. in e. Texas, adjoining Louisiana, bounded on the e. by the Sabine river; watered by Patroon creek; about 575 sq.m.; pop. '80, 4,161—4,152 of American birth. The surface is level and heavily timbered. The soil is fertile. The principal productions are corn and cotton. Co. seat, Hemphill.

SABINE, Maj. Gen. Sir **EDWARD**, a celebrated British physicist, of Irish extraction, was born in 1790. After serving in the royal artillery for some time, he was promoted to the grade of lieutenant, and accompanied capt. Ross (q.v.) and lieutenant Parry (q.v.) in their expedition (1819—20) to the n. coast of America (see **NORTH-WEST PASSAGE**), making during the voyage a series of magnetic observations of great value. These observations formed the substance of two papers which he communicated to the royal society on his return. A strong desire of continuing the investigation of this and other branches of experimental physics, prompted him to undertake a series of voyages to places between the equator and the north pole, making at each point observations on the length of the seconds pendulum, and on the dip and intensity of the magnetic needle. The fruits of these labors were of high importance, and were published, along with other information, in 1825. From this period his history is that of a studious investigator into the laws and phenomena of nature, broken only by a short term of military service in Ireland, during which he rose to the rank of major. In 1836 he communicated to the British association at Bristol his observations on the declination and intensity of the magnetic force in Scotland; and to the same association he delivered, at Liverpool, in 1837, a report on the variations of magnetic intensity at different parts of the earth's surface. The rest of his researches into the nature and action of magnetic force will be found in detail in the *Transactions* of the above-mentioned association of the royal society, and in the *Philosophical Transactions*. His labors have led to the discovery of the laws of "magnetic storms," of the connection between certain magnetic phenomena and the changes of the solar spots, and of the magnetic action (independently of heat) of the sun and moon on the earth. He deserves almost the sole credit of extending the body of known facts in magnetic science by the establishment of magnetic observatories in all parts of the world, and by the collation of the enormous mass of facts thus acquired. In 1818 Sabine was elected a fellow of the royal society; in 1850 he became its vice-president and treasurer, and in 1861 its president. He was for 21 years one of the general secretaries, and for 8 years sole general secretary of the British association, and filled the office of president in 1852. In 1856 he was raised to the rank of major-general; in 1869 he was created a knight-commander of the bath; and in 1875 a corresponding member of the French academy.

SABINE, **LORENZO**, 1803—77; b. N. H.; merchant, bank officer, and deputy-collector of Passamaquoddy, Maine. In 1851 he was elected to congress from Massachusetts. He

is best known as the author of the *American Loyalists*, address on the anniversary of gen. Wolfe's death, and other historical and biographical papers.

SABINE PASS, a seaport t. of Texas, the terminus of the St. Louis and Mexican Gulf railroad, and having communication with the interior of the state and Louisiana by the Neches and Sabine rivers; the water in its inner harbor is from 25 to 40 ft. deep. When the railroad to St. Louis is opened the town will become large and important.

SABINI, an ancient people of central Italy, whose territory lay to the n.e. of Rome. The boundaries of the territory cannot be determined with exactness, but it appears to have extended from the sources of the Nar, on the borders of Picenum, as far s. as the Anio. The nations conterminous to the Sabini were the Umbrians on the n., the Umbrians and Etruscans on the w., the Latins and Æqui on the s., and the Marsi and Picentini on the east. The entire length of the Sabine territory did not exceed 85 m., reckoning from the lofty and rugged group of the Apennines, anciently known as the *Mons Fuscellus* (now *Monti della Sibilla*), to Fidencæ on the Tiber, which is not more than 5 m. from Rome. The principal towns were Reate, Interocrea, Falacerinum, Nursia, Amiternum, Casperia, and Cures, but none of these places were of any size or political importance. The inhabitants had no inducements to congregate in large towns. Their country was an interior region; much of it, especially in the n., very mountainous and bleak, though the valleys were (and are) often richly productive; and thus cut off from the sea-board, and even from that easy access to their neighbors which lowland districts admit of, they (like all the other races who peopled the sequestered regions of the Apennines) scarcely advanced beyond the rude simplicity of their primitive highland hamlets. The Sabines were a brave, stern, religious race, whose virtues were all of an austere and homely character. Cicero speaks of them as *severissimi homines*, and Livy notes the *disciplina tetrica ac tristis veterum Sabinorum* ("the stern and grave discipline of the old Sabines"), while the poets of the empire—Horace, Virgil, Juvenal, etc., are fond of contrasting their simple, uncontaminated modes of life with the vicious luxury and dissipation of the capital. What part, if any, they had in the foundation of the city of Rome cannot now be ascertained, as the whole story of the Ramnes, Titides, and Luceres has come down to us in a purely mythical form (see **ROME**). Their native tutelary deity was "Sancus," or Semo-Sancus" = Lat. *Sanctus*, the "holy" or "venerable;" but like the other Latino-Sabellian races, they also worshiped Jove, Mars, Minerva, Sol, etc. That the Sabini were an ancient people in Italy is certain. They were probably most nearly allied to the Umbrians, whose tutelary god was also "Semo-Sancus;" and, in fact, they are generally considered an offshoot of that people; but they themselves, on the other hand, became so numerous that they were obliged to send forth numerous colonies, who founded new nations to the s. and e., the Picentes, Peligni, Samnites (q.v.) etc.; while the Samnites (a name essentially the same as *Sabini*; the Greek form *Sannitai* = *Savnites* = Oscan name *Safini* or *Sabini*) in their turn became the progenitors of the Lucanians, Campanians, and Bruttii. Hence the epithet *Umbro-Sabellian*, in use among classical ethnologists, to denote the whole of these kindred races, who were also allied, but less closely, to the Latins (see **LATINI**) and Oscans (see **OSCI**). Of the Sabine language only a few words remain, which, however, seem to indicate that it differed from the Latin only dialectically; thus, Lat. *hircus*, Sab. *fircus*; Lat. *hostis*, Sab. *fostis*, etc.; analogues to the Aberdeen *filk* for "whilk," *fat* for "what," etc. For further information see **ROME**, **HISTORY OF**.

SABLE, *Martes zibellina*, a species of marten (q.v.), so nearly allied to the common marten and pine marten that it is difficult to state satisfactory specific distinctions. The feet are covered with fur, even on the soles, and the tail is perhaps more bushy than in the British martens. The length, exclusive of the tail, is about 18 inches. The fur is brown, grayish-yellow on the throat, and small grayish-yellow spots are scattered on the sides of the neck. The whole fur is extremely lustrous, and hence of the very highest value, an ordinary sable skin being worth £6 or £7, and one of the finest quality £15. The fur attains its highest perfection in the beginning of winter, and the pursuit of the sable at that season is one of the most difficult and adventurous of enterprises. The sable is a native of Siberia, widely distributed over that country, and found in its coldest regions, at least wherever forests extend. The progress of geographical discovery in the eastern parts of Siberia has been much indebted to the expeditions of the hardy and daring sable hunters, exploring new regions at the worst seasons of the year, and spending dreary months at a great distance from all human abodes. The sable is taken by traps, which are a kind of pitfall, it being necessary to avoid injury to the fur, or by tracking it through the snow to its hole, and placing a net over the mouth of the hole. It is a very wary animal, and not easily captured. It makes its nest in a hollow tree, or sometimes, it is said, by burrowing in the ground, and lines it with moss, leaves, and grass. From this it issues to prey on hares and smaller animals of almost any kind, its agility enabling it even to catch birds among the branches of trees. It is ready, when food is scarce, to eat the remains of an animal on which a larger beast of prey has feasted, and is said even to satisfy its hunger with berries in winter, when animal food is not to be had.

SABLE, one of the tinctures in heraldry, implying black. In heraldic engravings it is represented by perpendicular and horizontal lines crossing each other.

SABLE ISLAND. See NOVA SCOTIA.

SABLES D'OLONNE, LES, a sea-port of France, in the department of Vendée. It owes its early importance to Louis XI., who excavated the port, and raised the fortifications. In 1688 its merchant marine was more important than that of either Nantes or Rochelle. The commerce is in grain, wines, cattle, fish (sardines), salt, etc. Pop. '76, 9,188, who are almost all engaged in a sea-faring line of life.

SABOTS, a species of wooden shoes much used by the French and Belgian peasantry, especially by those who inhabit moist and marshy districts, as an effectual protective of the feet from external moisture. The fabrication of sabots forms an important branch of French industry, and is chiefly carried on in the departments of Aisne, Aube, Maine-et-Loire, and Vosges. After being made they are subjected to the smoke of burning wood till they acquire that reddish color so much prized in certain countries.

SABRINA LAND, discovered in the Antarctic ocean, Mar. 20, 1839, by Balleny, in lat. 69° 53' s., long. 121° 8' east. See ANTARCTIC OCEAN.

SAC, a co. in n.w. central Iowa, watered by the Raccoon and Boyer creeks; about 575 sq.m.; pop. '80, 8,774—7,133 of American birth. The surface is rolling. The soil is fertile. The principal productions are corn, wheat, oats, and rye. Co. seat, Sac City.

SACCHARIC ACID ($\text{C}_2\text{H}_4\text{O}_4$) is a product of the action of nitric acid, under certain conditions, on grape and cane sugar, or on starch, gum, and lignine. It occurs as a colorless, inodorous, deliquescent, gummy, uncrystallizable mass, which is freely soluble in alcohol. It is sufficiently powerful to dissolve iron and zinc, with extrication of hydrogen. It has a tendency to form double salts, so that it is probably a bibasic acid.

SACCHAROMETER, an instrument for determining the quantity of sugar in liquids, especially brewers' and distillers' worts. In principle it resembles the hydrometer, used for ascertaining the strength of alcoholic liquids. It consists of a hollow sphere or oval of thin brass, with a graduated stem and a hook so placed opposite each other that, when placed in water, it floats, and the graduated stem stands upright on the top, and the hook is below, for the purpose of appending weights. The degree to which the stem sinks gives the means of calculating, by tables prepared on purpose, the proportion of saccharine matter present in the liquid.

SACCHARUM. See SUGAR-CANE.

SACCHINI, ANTONIO MARIA GASPARO, 1734-86; b. near Naples, Italy; educated in music at the San Ciro conservatory, Naples, and by Durante. His first and most successful opera was *Semiramide*, produced in 1762. In all he composed about 50 operas, most of which were brought out in Italy, but some in Germany, London, and Paris. Among the best were *Alessandro nell' Indie*, *Tamberlano*, and *Clélie à Colone*.

SACCOMYDÆ, a family of rodents comprising the pouched rats and gophers of North America, having large external cheek-pouches. Some of them have the fore-feet greatly developed and adapted for burrowing. Others, called kangaroo rats, have very long hind legs, while the fore legs are not specially developed. There is some confusion in the classification, as the kangaroo rats (*dipodomys*) more resemble the jerboas of Africa (*dipodidae*). The term gopher having been applied to various burrowing animals with generic and family differences, has led to the confusion.

SACCOTOO. See SOKOTO.

SACHEVEREL, HENRY, D.D., was b. in the year 1672, at Marlborough, where his father was minister of St. Peter's church, and noted for his attachment to the high church principles, which were afterward embraced by his son. The youth was educated at the grammar-school of his native place, and at Magdalen college, Oxford, where he occupied chambers along with the celebrated Addison, who then and for many years afterward seems to have entertained for him a warm regard. He obtained a fellowship in his college, and took successively the degrees of M.A. (1696), of B.D. (1707), and of D.D. (1708). In 1705, he became preacher of St. Saviour's, Southwark; and in 1709, he delivered the two sermons—one at the assizes at Derby, the other on Nov. 5, at St. Paul's—which have given him a place in the history of his country. The rancor with which he attacked in these sermons the principles of the revolution settlement, asserted the doctrine of non-resistance, and decried the act of toleration, excited the indignation of the whig government of the hour, and led to his impeachment for high crimes and misdemeanors. His trial before the house of lords took place in the spring of 1710, and resulted in his being found guilty, and suspended from preaching for three years, the obnoxious discourses being ordered to be publicly burned by the hangman. Of the rage of factions on the occasion, the fury of the popular excitement, and the excesses of the high church party, an account in detail will be found in any history of the period. Sacheverel became for the time the most popular man in the kingdom, and the general election which followed was fatal to the government which had prosecuted him. When, in 1713, his suspension as by sentence expired, as a special mark of honor he was appointed by the new house of commons to preach before them the sermon on the anniversary of the restoration, and specially thanked on the occasion. A more substantial token of favor was his presentation to the rectory of St. Andrew's, Holborn.

Subsequently—except that there is some reason to believe he was more or less concerned in a plot to restore the Stuarts—he disappears from the sphere of history. He is said, in his later years, to have sought the excitement which may in some sort have become necessary to him, in a series of paltry and undignified squabbles with his parishioners. Nor in this is there anything improbable. His character was essentially a weak, vain, and shallow one, and he remains notable merely as one of those men, intrinsically insignificant, who have had a spurious notoriety and importance thrust upon them by the accidents of foolish activity in a special concurrence of circumstances. See Burton's *Reign of Queen Anne* (1880).

SACHS, HANS, the most prolific and at the same time the most important German poet of his time, was b. on Nov. 5, 1494, at Nürnberg, where his father was a tailor. While at school he learned the rudiments of Latin, but at no time of his life could he be called a scholar in the strict sense of the term, although he was certainly a well and widely-informed man. About the age of 15, he was sent to learn the craft of shoemaking; his love of verse, however, also led him to become a disciple of Leonhard Nunnenbeck, weaver and *meistersinger* in his native town. On finishing his apprenticeship, Sachs, as was the custom of craftsmen in those days, made a sort of tour or pilgrimage through Germany, frequenting assiduously the verse-making schools or corporations organized by the trade-guilds in the different cities, the members of which, known as *meistersingers*, had, since the disappearance of the older *minnesingers*, or minstrels of chivalry, become the chief representatives of German poetry. On his return to Nürnberg, he commenced business as a shoemaker, prospered in his calling; and after a long, cheerful, and happy life, died on Jan. 25, 1576, at the age of 82. Sachs was twice married—first to Knechtgunda Kreutzer, who bore him five sons and two daughters; and afterward, in his 66th year, to Barbara Harscher. His grave is still to be seen in St. John's churchyard, Nürnberg. Sachs's career as an author is divided into two periods. In the first, he shows an interest mainly in the occurrences that were then agitating Germany. It was the epoch of the reformation of Luther, whose praises he celebrated (1523) in an allegorical tale entitled *Die Wittenbergisch Nachtigal*, while his poetical fly-sheets (of which about 200 are known) furthered in no small measure the Protestant cause. In the second period, his poetical activity was turned more to the delineation of common life and manners. His poetry is distinguished by its heartiness, good sense, homely genuine morality, and freshness; its clear and healthy humor, and its skillful manipulation of material. It is, on the other hand, deficient in high imagination and brilliant fancy, and contains large tracts of dry, prosaic, insipid verse. Sachs's best productions are his *Schwänke*, or merry tales, the humor of which is sometimes unsurpassable; but his serious tales, allegorical and spiritual songs, and his dramas, also show a great advance on his predecessors. His special *meistergesänge*, on the other hand, are of little or no value. Manuscript copies of Sachs's poems—some in his own handwriting—are to be seen in the libraries at Zwickau, Dresden, Leipzig, and elsewhere. When Sachs had reached the 52d year of his career as a poet, he took stock of his work, and found that he had written 34 vols., containing upward of 6,200 pieces, among which were 4,275 *meistergesänge*, 208 comedies and tragedies, about 1700 merry tales, secular and religious dialogues, proverbs, and fables, 7 prose dialogues, and 73 songs, secular and devotional. The first edition of his works was published at Augsburg in 1558, but the best is that of Willer (5 folio vols. 1570-79); a later quarto edition, known as the *Kemplerer*, appeared in 1612-1617, and was republished at Augsburg in 1712. After the middle of the 17th c., when a deep stupor seized the German mind, and it could produce nothing but endless tomes of theology, varied by an occasional hymn of more or less merit, Sachs's, with all his poetic brethren, suffered a total neglect, from which he did not recover till Goethe wrote his pleasant poem, *Hans Sachs, Erklärung eines alten Holzschnitts vorstellend Hans Sachs's poetische Sendung* (1776), since which time partial collections of Sachs's works have frequently appeared.

SACK, a large bag made of a coarse hempen cloth called sacking or sackcloth. Such bags are used for the conveyance of corn, flour, and other bulky articles. A corn-sack is usually made to contain four bushels, hence it is constantly spoken of as a measure of quantity, two sacks being equal to one quarter of corn.

SACK. A name in common use in the time of Shakespeare, and occurring down to the middle of the 18th c. as denoting a kind of wine. The exact nature of this famous wine, the favorite beverage of Falstaff, and the origin of the name, have been much discussed. Sack or seck seems to be simply an English disguise of the Spanish *seco* (Fr. *sec*), applied to wines of the sherry genus, as distinguished from the sweet wines; a term which we now translate by "dry."

SACKBUT (Fr. *saquebute*), the name under which the trombone (q. v.) was known on its first introduction to England.

SACKETT, DELOS B., b. N. Y.; graduate of West Point 1845; served in the Mexican war with the 2d dragoons at Palo Alto and Resaca de la Palma; brevetted capt.; rose through successive grades to col. and inspector-gen., 1861. In the war of the rebellion he served on the staffs of McClellan and Burnside through the principal battles in Maryland, and on the peninsula including Fredericksburg, and was brevetted maj.-gen. U. S. army, 1865.

SACKETTS HARBOR, a village and port in New York, U.S., on the s. shore of Black river bay, 8 m. e. of lake Ontario, 170 m. w.n.w. of Albany, having a navy-yard, barracks, mills, etc. In the war of 1812, it was an important port, where the frigate *Superior*, of 66 guns, was built in 80 days, and the *Madison* in 45 days, from timber standing in the forest. A man-of-war of 3,200 tons, begun before the treaty of disarmament, is still upon the stocks. The town has declined since the war, and has now a population of but (1875) 734.

SACKVILLE, GEORGE GERMAIN, Viscount, 1716-85; b. England; son of the first Duke of Dorset. He entered the army, was at Dettingen and Fontenoy, was appointed lieutenant-general: led the allied cavalry at Minden 1759, and for his failure to carry out the order of the commander-in-chief to charge the French cavalry, was court-martialed. As lord George Germain, he was colonial secretary during the revolutionary war.

SACKVILLE, THOMAS, Earl of Dorset, an English poet and statesman, was b. at Buckhurst, Sussex, in 1536. He was the only son of sir Richard Sackville; studied at Oxford and Cambridge, where he acquired a high reputation as a poet both in Latin and English, and afterward became a student of the inner temple. While a member of this society, he wrote, along with Thomas Norton, a blank-verse tragedy, called *Ferrex and Porrex* (afterward called *Gorboduc*), which was performed before queen Elizabeth at Whitehall in 1561-62. This work, the plot of which is founded on a British legend, claims particular notice as the earliest tragedy in the English language. It is molded to some extent on the classic drama, the incidents being moralized at intervals by a chorus. It has no dramatic life or energy, but the style is pure and stately, evincing eloquence and power of thought. Sackville's other productions (first published in 1563) are the *Induction*, a poetical preface to the *Mirror for Magistrates*, and the *Complaint of the Duke of Buckingham*, which was designed to conclude the work. The *Induction* is a noble poem, uniting, as Hallam says, "the school of Chaucer and Lydgate to the *Fairy Queen*," and almost rivaling the latter in the magnificence and dignity of its allegoric personifications. The influence of Dante is very perceptible. Sackville now abandoned literature, and after traveling in France and Italy, returned to England, and entered public life. Soon after his father's death in 1566, he was created lord Buckhurst, became a favorite with the queen, who employed him in foreign diplomacy, and on the death of Burleigh, succeeded him in his office of lord high treasurer (equivalent to prime-minister in those days), in which capacity he showed himself not inferior in sagacity and fidelity to his great predecessor. On the accession of king James, his patent of office was renewed for life; and in the following year, he was created earl of Dorset. Sackville died April 19, 1608, and was buried with ceremony in Westminster abbey. His works are edited by the rev. Sackville West, in Smith's *Library of Old Authors* (Lond. 1859).

SACO, a river of New England, U.S., rises in the White mountains of New Hampshire, runs south-easterly through the south-western portion of Maine, through Saco bay, to the Atlantic ocean. Its course of 160 m. is almost a continuous succession of falls, the last being but 4 m. from its mouth, affording water-power to numerous factories.

SACO, a t. in Maine, U.S., is built on the e. bank of the Saco river, at its last falls, 4 m. from its mouth, 14 m. s.w. of Portland. It has numerous manufactories, including 5 cotton-mills, which produce 7,000,000 yards annually, 4 saw-mills, and several ship-yards. Pop. '70, 5,755.

SACO (*ante*), a city in York co., s.w. Maine, taken from Biddeford with the name of Pepperellboro, in 1762; on the Portland, Saco and Portsmouth, the Boston and Maine, and the Eastern railroads; pop. '80, 6,396. It is connected with Biddeford on the w. side of the river by 4 bridges. The river is open to vessels of 9 ft. draught for 9 months in the year. It has several hotels, and surroundings of great natural beauty, the fashionable watering-place of Old Orchard Beach being within 3½ m. easy drive. It has a brisk coasting trade, and its industries comprise the manufacture of cotton machinery, boots and shoes, belting, brushes, loom harness, etc. The York Manufacturing company's cotton-mills employ 1000 operatives. It has a weekly newspaper, a beautifully shaded common, a city hall, a fire department, 2 national banks with an aggregate capital of \$200,000, 2 savings-banks with \$1,500,000 deposits, a fire-insurance company, and an atheneum with a library of 2,000 vols.

SACRAMENT (Lat. *sacramentum*, *mysterium*, Gr. *mysterion*), the name given by theological writers to certain religious rites, the number as well as effects of which are the subject of much controversy between various bodies of Christians. The word *sacramentum*, in primitive classical usage, meant either the oath taken by soldiers on their first enrollment, or the sum of money deposited by suitors on entering upon a cause, and forfeited "to sacred uses" by the unsuccessful party; and the corresponding classical Greek word *mysterion* meant not merely the secret religious ceremonies practiced in the worship of certain gods, but also any revealed secret. It is certain, nevertheless, that at a very early period of the Christian church both the Latin word and its Greek equivalent came to be applied specially to certain rites of the Christian ceremonial, and chiefly (or as is commonly held by Protestants, exclusively) to those of baptism and the

eucharist. Of the catechetical lectures of St. Cyril of Jerusalem, the lectures devoted to the subject of baptism and the eucharist are called "mystagogic lectures." For our purposes, it will be enough to state concisely what are the views of the several religious communities on this much controverted subject, which formed one of the earliest grounds of division between the Roman church and the reformers of the 16th century.

In the Roman church it is held that there are seven sacraments, viz.: baptism, confirmation, the eucharist, penance, extreme unction, holy orders, and matrimony. The special teaching of Catholics on each of these rites will be found under the several heads; but there are certain general principles regarding them all, on which the Roman Catholic doctrine differs widely from that of the Reformed communities. Catholics define a sacrament to be a visible or sensible sign permanently instituted by God, and conveying real interior grace to the recipient, and they teach that all sacraments contain within themselves, as instruments, and, when they are received with proper dispositions, produce such grace by the virtue imparted to them by God, and not merely through the faith of the recipient; although they hold that proper dispositions on the part of the recipient, as sorrow for sin, love of God, pious resolves, etc., are conditions indispensable for the efficacy of the sacramental rite. See *OPUS OPERATUM*. They divide the sacraments into two classes, "sacraments of the living," and "sacraments of the dead." The first class comprises the eucharist, confirmation, holy orders, and matrimony—all which sacraments can only be received fruitfully by persons in a state of grace or justification. The second includes baptism, penance, and extreme unction, the special purpose of which is to remit sin, and which therefore can be received by persons in a state of sin, but penitent for that sin, and resolved to amend their lives. Of three of the sacraments, viz., baptism, confirmation, and holy orders, it is held that they imprint a "character," and therefore that they can only be received once. The others may be repeatedly received, but under conditions which will be learned under each separate head. Two things are held to enter into the constitution of the sacrament—viz., the "matter" and the "form." By the former is meant the material element or the physical action whereby that element is applied to the recipient of the sacrament; as water in baptism, oil in extreme unction, and in both the act of washing or of anointing. By the latter is understood the form of words employed by the minister in communicating to the recipient the external rite in which the sacramental act consists. The minister of a sacrament is the person who is supposed to be divinely authorized to impart it. The minister is different for different sacraments, as will be found under each separate head.

The reformed churches have for the most part discarded these views. By the majority of them the sacraments are held to be merely ceremonial observances, partly designed as a solemn act, by which each individual is admitted to membership, or desires to make solemn profession thereof; partly intended to stimulate the faith and excite the fervor and the pious dispositions of the recipient, to which dispositions alone all the interior effects are to be ascribed. As to the number of rites called by the name, almost all Protestants agree in restricting it to two—viz., baptism and the Lord's supper; although some of the rites which Catholics regard as sacramental are retained by some of the Protestant communities as religious observances. In the English church, however, there has always been a school in which opinion tending toward the Catholic view has prevailed. Not only has this school ascribed to the two rites of baptism and the eucharist or Lord's supper (q.v.) the power of producing an interior grace (which in the former is called regeneration); but many of them have been willing to call the other rites, especially confirmation, penance, and holy orders, by the name of sacrament, although of a secondary character, and not "generally necessary to salvation." See *TRACTARIANISM*. The controversy on these questions has been in recent times the subject of more than one proceeding in the ecclesiastical courts and in the privy council.

SACRAMENTARIAN, the name given in the 16th c. to the party among the reformers who separated from Luther on the doctrine of the eucharist. Luther (q.v.) taught the doctrine of the real presence of the body and blood of Christ along with the bread and wine (see *LORD'S SUPPER*; *REAL PRESENCE*). The first of his followers who called this doctrine in question was Andrew Carlstadt; and notwithstanding the protest of his leader, Carlstadt had many followers, the most active of whom were Capito and Bucer. The party became so considerable, that in the diet of Augsburg they claimed to present a special confession distinct from that put forward by the general body. The sacramentarian confession is known in history by the name of the tetrapolitan confession—so called from the four cities, Strasburg, Constance, Lindau, and Memmingen. The tetrapolitan confession rejects the doctrine of a corporal presence, and although it admits a spiritual presence of Christ which the devout soul can feel and enjoy, it excludes all idea of a physical presence of Christ's body. Simultaneously with this German movement, yet independent of it, was that of the Swiss reformer Zwingli, whose doctrine on the eucharist was identical with that of Carlstadt, and who himself presented a private confession of faith to the Augsburg diet, in which this doctrine is embodied. The four cities named above continued for many years to adhere to this confession presented to the diet of Augsburg in their name; but eventually they accepted the so-called confession of Augsburg, and were merged in the general body of Lutherans. On the contrary, the article of Zwingli upon the eucharist was in substance embodied in the confession of the Helvetic church.

SACRAMENTO, a large river in California, which, with the San Joaquin, drains the great central valley. It rises in the north-eastern part of the state, in the Sierra Nevada, by north and south forks, where, during its south-westerly course of 200 m., it is called Pitt river and Upper Sacramento; thence it flows nearly due s., receiving numerous branches from the Sierra Nevada on the e., and the coast-range of mountains on the w., until it unites with the river San Joaquin, and flows westerly through San Pablo and San Francisco bays to the Pacific ocean. It is navigable to Sacramento, 50 m. from San Pablo bay, and for small vessels 150 m. further, its entire length being about 500 miles.

SACRAMENTO, a co. in n. central California, bounded on the w. by the Sacramento river, drained by the Cosumne, the American, and the San Joaquin rivers, traversed by the Central Pacific railroad; about 1100 sq.m.; pop. '80, 34,291—21,897 of American birth. The surface is mostly level, without timber. The soil is fertile. The principal productions are barley, wool, hay, fruit, and hops. Gold is found. Co. seat, Sacramento.

SACRAMENTO, a city and port of entry and capital of California, is built on the e. bank of the Sacramento river, 125 m. from the sea, lat. 38° 33' n., long. 121° 20' west. The streets cross each other at right angles on a level plain, only 30 ft. above the sea. The stores and shops are built of brick, the dwellings of wood, with shade-trees and gardens. The principal public buildings are the state capitol, custom-house, and post-office. The chief trade is furnishing supplies to the mining districts, with which it has daily communication by steamers and stages. Sacramento was settled in 1839 by capt. Sutter, a Swiss, who built a fort. In 1848 the first town-lots were sold, and the first house built in 1849. In 1853 the town was inundated to the depth of five feet in the streets, which have been raised and protected by embankments. In 1854 it became the state capital, and in 1870 had a population of 16,283.

SACRAMENTO (*ante*), capital of California and of Sacramento co.: at the junction of the American and Sacramento rivers, about 75 m. n.e. of San Francisco in an air line, and by water 120 m.; it is the terminus of the California Pacific, and is a station on the Central Pacific railroads; pop. '80, 21,240; exceeded by only two cities of the state, San Francisco and Oakland. It may be reached by boat from San Francisco. The situation of the town is very low, and in former years it suffered greatly from inundations, but the business section is now raised several feet above the original level, and the rest of the city protected by a levee constructed in 1862 at a cost of \$250,000. The climate is semi-tropical, and there are many gardens noted for the beauty and variety of flowers, trees, and shrubs, of which some are always in bloom and many are of species unknown in the east. The streets are regularly laid out and designated by numbers and letters. The principal public buildings are the state capital, one of the finest edifices of the kind in the country, erected in 1861 at an expense of \$2,500,000, and standing in the midst of a beautiful park of about 50 acres; the governor's residence, masonic and other society halls, the Sacramento library, the hall of the state agricultural society, a convent, hospitals, and a theater. The city has been visited by two destructive fires, one in 1852, which destroyed over 600 buildings, and the damage from which was estimated at \$5,000,000; the other, two years later, with an estimated damage of \$650,000. Sacramento is favorably situated for intercourse with the interior of the state, and has a very large trade with the mining and agricultural districts, supplying them with provisions and necessaries, and receiving and shipping their products. Here are several refining and smelting works, flouring mills, breweries, and manufactures of furniture, liquors, machinery, agricultural implements, carriages, etc. The machine, car, and repair shops of the Central Pacific railroad are very extensive, employing nearly 1500 men. There are 19 schools, 14 churches, a high school, normal school, and college for women, several banks, and 3 daily papers. The Chinese pop. is estimated at about 2,000.

SACRARIUM, a sacred apartment in Roman houses.

SACRED HEART OF JESUS, FEAST OF, a modern festival of the Roman Catholic church. Its origin is traced to a vision which is recorded of a French nun, of the order of the Visitation, named Mary Margaret Alacoque, who lived at Paray la Moniale, in Burgundy, in the latter half of the 17th century. This devotion was gradually propagated in France, and at length was approved by Pope Clement XII. in 1732 and 1736, and by Clement XIII. in 1765. The festival is held on the Friday after the octave of Corpus Christi. During recent years a fresh impulse has been given to the devotion, and in 1873 numerous bodies of pilgrims resorted to Paray la Moniale; and several dioceses and countries were dedicated to the sacred heart by special and solemn ceremonial. The confraternities of the sacred heart are very numerous.

SACRED HEART, LADIES OF THE, a religious order of the Roman Catholic church, founded in Paris in 1800 by Joseph Désiré Varin, Madeleine Berat, and Octavie Bailly. The object of the order was the education of young ladies of the higher classes. The constitution was approved by Leo XII. in 1826; a house was opened in Rome and branches established in many cities. The first house in the United States was established by bishop Dubourg in 1817, near St. Louis. They have now about 20 houses in this country.

SACRED MUSIC. Music has, from very early times, been connected with religious rites. It entered into the worship of the Jews, and both sacred and profane history tell us that, in the primitive Christian church, the service consisted partly of music. Little is known regarding the kind of music used by the early Christian converts; it has been supposed to have been partly Greek, with an intermixture of Hebrew melody. As early as the time of Ignatius, who was a disciple of St. John, the Psalms of David were sung *antiphonally*, as practiced to the present day—i. e., by two choirs responding to each other, which had doubtless been formerly the practice among the Jews. At first the whole congregation, clergy and laity, joined in the psalm; but difficulties and abuses having arisen from the growing neglect of musical culture, the council of Laodicea, in 363, found it necessary, for the securing of decency and order in worship, to prohibit the laity from singing in church except in certain chants of a very simple and popular character. From that period down to the reformation, the music of the church was almost entirely surrendered to the clergy and trained musicians. See **PSALMODY**.

The first name of importance in the history of the music of the western church is St. Ambrose, (q. v.), whose musical service (see **AMBROSIAN CHANT**) was reformed by pope Gregory (see **GREGORIAN CHANT**). The use of the organ in churches dates from about the 9th c., and some centuries later counterpoint (q. v.) was introduced to a limited extent into the music of the church. Among the corruptions which followed it, some are of a nature the very mention of which startles us. Not merely were popular melodies of a secular nature often taken and worked up into church music, but the secular words were actually transplanted into the religious compositions, being habitually given out by the tenor voice, while the actual solemn words of the church service were being sung by soprano, alto, and bass. Papal bulls having sought in vain to combat this abuse, it was brought under the cognizance first of the council of Basel, and then that of Trent. The council of Trent prohibited the performance of any mass or motett of which profane words formed a part, and also of music founded on secular themes. Some compositions of Palestrina were singled out for praise, and their author was intrusted with the task of remodeling this part of religious worship. He composed three masses on the reformed principle, one of which, known as the *Missæ Pape Marcelli* (so called as being a tribute of gratitude to the memory of that pontiff), may be looked on as having saved music to the church, by establishing a type far higher than anything that had preceded it, and still revered by all lovers of music. The *mass* (including the *offertory* and *gradual*) has always continued to be an important part of the sacred vocal music of the Roman Catholic church, and affords large scope for the display of the higher qualities of musical composition.

Various new types of music sprang up in the different Protestant churches after the reformation. The solemn and measured *chorale* (q. v.), or melody to which psalms or hymns are sung in unison, though generally associated with the Lutheran church of Germany, was in reality handed down from a very early period. Psalmody in its modern sense may be considered to have originated in the 16th c., when Clement Marot, the court poet of Francis I., translated fifty-two of the Psalms into French verse. Psalm-singing was at first a fashionable amusement of the gay courtiers of Francis; but, being taken up by the reformers, was soon discountenanced by the Roman Catholics, and looked on as a badge of Protestantism. See **PSALMODY**.

In the full choral service of the church of England, as performed in cathedrals and collegiate churches, the greater part of the prayers and the litany are *intoned* or read in monotone (see **INTONING**), the monotone being occasionally varied by harmony at the close. The Psalms and *Gloria Patri* are chanted with the accompaniment of the organ, as also are the various canticles; the latter, however, particularly the *Te Deum*, being often sung to rhythmical music of a more elaborate kind, called *services*. The form of the Anglican chant now used for the Psalms seems to have been invented by Tallis. In the single chant each verse is sung to the same music; in the double chant, the whole occupies two verses. The antiphonal chanting, with the Anglican double chant, has sometimes been objected to as repugnant to the proper expression of the words, as coupling verses between which there is a full stop in the sense, and as placing a full stop when the sense runs on; and among the high church party there has been a disposition to recur to the Gregorian chants, whose indefinite musical expression, absence of rhythm, and uncertain accent, give them a power of lending to the requirements of the words. The Gregorian chant has, however, not succeeded in making its way into the service of any of the English cathedrals. The *anthem* forms a part of the complete musical service. It is somewhat similar in character to the motett of the Roman Catholic and Lutheran churches; a sacred cantata, in which the words are taken from the Psalms or other portions of Scripture; and the music is for solo, parts, or chorus, or a mixture of the three.

In the Presbyterian churches of Scotland, psalmody, until recently, formed almost the entire music; but hymns also are now in general use. Hymns predominate among the English dissenters. Some years ago, church music in Scotland had fallen to the lowest state of degradation; but efforts have lately been made, with some success, to raise its character. Even organs, which were proscribed by the early Scottish reformers, and have ever since been in disfavor, have begun to be introduced, and chanting has been admitted into some Presbyterian churches.

Of sacred musical compositions not intended to form part of the service of the church, the most important is the *oratorio* (q.v.), a composition either entirely dramatic, or combining the drama and epic, where the text is illustrative of some religious subject, and the music consists of recitatives, airs, part-songs, and choruses, accompanied by orchestra and organ.

SACRIFICE, one of the most important elements of divine worship, common to all nations of antiquity, and therefore traced by some to a primeval revelation. The powers of nature, palpable in their effects for good and evil, could not but inspire man, even in his rudest stage, with gratitude or fear toward the unseen being or beings by whom he conceived them to be actuated. The next and most natural step was the outward manifestation of these feelings by a token which bespoke either thankfulness or the wish of conciliation on the part of the donor. The supreme numina being conceived merely as superior men with exaggerated human wants, the means taken to gratify them were adapted to this conception. The best and first fruits of the soil, the finest and most immaculate animals of the flock, were offered to the gods, that they might either partake of them bodily or at least enjoy the sweet smell arising from the altar on which they were burned in their honor; and the deity was supposed emphatically to express its readiness to accept the offering by sending down the fire that was to consume the animal prepared. The more the divine favor was sought for some special purpose, the costlier and more precious became the gift; and nothing short of the most startling proofs of self-abnegation seemed, at times, to satisfy the devotion of man in his uncultivated state. From the simple and child-like notion of establishing a certain kindly and permanent relation between the invisible powers and man, by the yielding up on the part of the latter a certain more or less precious portion of what the former had given him, there grew up such horrible monstrosities that, in honor of humanity, we should feel inclined to doubt them were they not so well attested, and did they not, to a certain extent, still prevail in our own days. Method and system took in hand that undeveloped child-like instinct which touchingly offered the deity a flower, a blooming bough, a golden fruit, and degraded it into mysticism and superstition, ending at last in the theory that the divine revenge was to be gratified, the divine vanity flattered, and the deity made as generally pleased as could be by holocausts of human beings, friends or foes—nay, the dearer the being to the offerer the more the self-abnegation must become patent, and the more the god must smile upon the donor. The Moloch worship—the mother placing her babe in the arms of the monstrous idol, and seeing it slowly burned before her own eyes—seems well nigh to exhaust all the horrors of human ingenuity.

Turning first of all to those most ancient and hallowed records of humanity contained in the Old Testament, we find the custom of sacrifice almost on its first pages, and spoken of as a rite already established. Sacrifice is the cause of the first murder on record. Abraham is prevented by a voice from heaven from carrying out the slaughter of Isaac, into which he had been "tempted" by Jehovah; all the patriarchs, in fact, sacrifice, either independently or in ratification of a covenant; and the exodus itself was brought to pass under the pretense of the people having to offer up their wonted sacrifice in the desert.

According to the highest ancient authorities, both Jewish and Christian—of whom we will only mention Maimonides and Ephraem Syrus—the Mosaic sacrifices were neither more nor less than a kind of divine concession to the sensual nature of an uncultivated people, full of Egyptian reminiscences on the one hand, and surrounded by Canaanitish modes of worship on the other. It was, as Ephraem Syrus says, only at a very late period that Moses, by the command of God, in whose eyes the rites of priests and sacrifices have but little value, prescribed these observances to his people, on account of their weakness and hardness of heart—lest they might despise a "naked" religion, and attach themselves to false gods, whose magnificent and dazzling cultus surrounded them on all sides. In corroboration of this view, the prophets are appealed to, who never cease to inveigh against sacrifice as such, when, according to their view, the people were educated enough to do without this symbol and to worship God in truth and in spirit. (Compare Jeremiah vii. 22; I. Samuel xv. 22; Psalms I. 8-10; li. 18, 19; Isaiah i. 11, etc.) But the institution being deemed necessary for the time, legislation had to circumscribe it rigorously, so as to make it as little hurtful as possible. Ceremonies contrary to morals and decency, such as were practiced in the temples of Canaan, the abominations of phallic rites, the sacrifices of virginity, and, finally, the offering up of human beings, were punished with instant death by the Mosaic law.

How the principal modes of sacrificial offerings, such as they had naturally developed nearly alike everywhere throughout antiquity, and as they had obtained in the pre-Mosaic times among the Hebrews, were adopted in the Mosaic legislation, and adapted to its exalted religious character, we can only indicate here in the briefest outlines. These pre-Mosaic sacrifices were chiefly of three kinds: first, the "propitiatory," i.e., an offering enjoyed by the deity in any form that would be grateful to him, conciliate him, procure his aid and blessing in times of need or for some special undertaking, and would further obtain his forgiveness, if something had been done unwittingly that might have offended him. This kind of sacrifice, whether bloody or unbloody (e.g.,

harvest sacrifice), appears to have been fully burned (*Olah*). The second kind partook more of the nature of sacrificial meals, in which both the divinity, the priest, the man who offered the sacrifice, together with his friends, took a part. It was a solemn and joyous oblation, expressing the thanks of the individual for some obtained favor, in which he wished others to join. Only the parts supposed to be the choicest were burned upon the altar; the priests received some other parts, and the rest formed the grateful sacrificial repast (*Sébach Shelamin*). The last was the expiatory sacrifice, intended as an equivalent for some deadly crime, which either was not punishable by the existing laws, or which had been committed under circumstances that would not have warranted capital punishment. From the notion that the blood of the murderer was necessary for "the cleansing of the blood that is shed" (cf. Numb. xxxv. 33) sprang that other, it would appear, that there was expiatory power in the blood itself; and that further, the blood of an animal was a fitting representative of, and equivalent for that of the human criminal, who had only to transfer, as it were, his sin to the animal by placing his hand upon its head, and perhaps using a formula to that effect. The flesh of this animal was not deemed fit for the altar, and was probably burned at some other place (*Chattath, Asham*). The Mosaic legislation, finding such general elements ready, proceeded eclectically. They were partly embodied with considerable alterations, and partly rejected unconditionally. The anthropopathic idea of the "agreeable smell," as well as the notion of the expiatory power of the blood, were retained—the latter, however, with this modification, that the poor were allowed to use flour instead of meat for their sin-offerings. But the principal alterations introduced were the abolition of all polytheistic rites from the sacrificial service, of all the immoral, obscene, and horrible ceremonies connected with the heathen practice, and finally, the totally different definition and limits given to the "sin-offering." While formerly everything could be expiated by a sacrifice, henceforth only unpremeditated sin could by this means be effaced; while there was no expiation for any premeditated crime; the law simply took its course in that case.* Further, many things till then permitted were prohibited, and thus fell under the denomination of "sin," and certain purifications—beneficial in themselves—were connected with the expiatory sacrifice, and their practice thus strongly enforced. This extension of the notion of "sin-offering" rendered a subdivision of it necessary; the more venial, or rather unconscious transgressions, were treated differently from the less pardonable ones in the ritual.

While Mosaism thus seemed, in its adoption of the rite of sacrifice, to make one of the most important concessions to heathenism, this very rite was, on the other hand, calculated to attract the early Hebrews to the worship of Jehovah, and at the same time to wean them from the horrible practices connected with it among the Canaanites. But more: during the primary stages of the people's existence it served, by inculcating observances which were at once hygienic and symbolic of purity and holiness, as a powerful means of education and culture. In order, however, that these beneficial consequences premeditated by the law-giver should not be frustrated, it was necessary above all things to keep the strictest possible supervision over it; and this was best established by the legal transfer of the whole sacrificial service to one single spot of the land, finally, the temple at Jerusalem. The "heights" and their "heathen abominations" were thus theoretically abolished, and the sacrifice that only at one central point could in reality be said to be offered up for the "whole community of Israel," went far, under these circumstances, to awaken and to strengthen a common spirit of nationality and patriotism, which was further aided by the periodical pilgrimages. For the details of the Jewish sacrifices we must refer to the Old Testament generally.

As to the different opinions held by Jewish and Christian authorities regarding sacrifice when offered up in expiation of a sin, either by the people or by individuals, suffice it here to mention that they are divided between the various notions of the offering being either a present to the offended deity, a civil punishment (*multa*), or, finally, a kind of substitute for the sinners themselves. The latter is the view held by many of the rabbinical writers as well as church fathers. The life (*Nephesh*) of the animal or its blood (Lev. xvii. 11) was distinctly said to make "the atonement for the soul." This notion of a representative victim is one that belonged to the whole ancient world, and often finds its expression in the Old Testament. The sacrifice of the covenant (Jer. xxxiv. 18, etc.), the scapegoat (Lev. xvi. 21), and the like, are so many embodiments of this idea, which by Christian divines is held to have found its acme and final fulfillment in the sacrifice of God himself, as the "Man Christ," who united in himself the priest, the offerer, and the sacrifice. In fact, the whole institution of sacrifices is throughout the New Testament and the fathers held to have been merely typical of this final act, by which the sin of man was expiated. See ATONEMENT, MASS.

The Jewish sacrifices, rejected already by the Essenes, ceased with the downfall of the temple in Jerusalem, although the Samaritans, who claim to retain exclusively the Mosaic covenant, still continue this rite on mount Gerizim on the Passover. The orthodox Jews, however, include in the prayers for the restoration of the visible sanctuary

* One of the most characteristic exceptions, however, was that in favor of those who had denied the possession of some pledged article, or who had wilfully cheated or robbed their neighbors. If they were eager to make voluntary and ample restitution, "the door of repentance was opened to them," and they were allowed to make public expiation through sacrifice.

on Zion also that of the restoration of the sacrifices "in their order and proper rule," "of the priests to their service, and the Levites to their songs and hymns," and each day, Sabbath or feast, the sacrifice incumbent upon it is mentioned in the prayers; and on fast-days, especially on the day of atonement, the diminution of bodily substance supposed to arise from the abstinence, the "the fat and blood" may, it is supplicated, be considered by God as tantamount for that of the sacrificial animals which, through their sins, the people are not now deemed worthy of offering up. The modern (extreme) party of reformed Jews, however, repudiate, together with the literal interpretation of the Messianic prophecies, also that notion of the sacrifices ever being restored again.

We can only very briefly touch upon the sacrificial customs among other nations of antiquity. The same feeling of dependence upon supreme, invisible, but ever-present powers, engendered, as we said at the beginning, everywhere nearly the same expressions of awe, gratitude, and the like. The gifts proffered differed, according to the degree of culture, the mode of life, and the products of the soil among the different peoples. No less was the significance attached to the gift different in proportion to the mental development of those who offered; at one time considered as a present, to be taken and sensually enjoyed, as it were, by the Deity, it at others assumed a higher and purely symbolical aspect, as an expression of gratitude, love, repentance. In the same proportion, the gifts themselves varied, not only respecting their nature, but also respecting their value. While Mongols and Tartars, Lapps and Negroes, most of the ancient nomad tribes in fact, generally sacrificed the milk and the uneatable parts of the animal only, its bones, horns, skin, etc., the Greeks and Romans offered not infrequently thousands of the choicest, most immaculate animals, and the sacrificial vessels were with them, as with the Hebrews, wrought of the most precious metals. Votive offerings—arms, spoil, garments, tools, locks, poems, etc.—customary in the better days of Rome and Greece, and the sacrifice of chastity on the part of maidens and women—chiefly the custom of Babylon, Phenicia, Cyprus, etc.—likewise fall under the denomination of sacrifice in its wider sense. Among the Indians, Bactrians, Medes, and Persians, the sacrifices consisted of fruits, libations, animals, and the like, and were of many degrees and numbers. Among the first-named, the study of the Vedas was reckoned as the first round in the sacrificial ladder. With the Persians (see GUERRES, PARSEES), the priests at the Darvns sacrifice, instituted in honor of Zerdusht the law-giver, eat small unleavened cakes, and drink Hom-juice, which is to represent the blood of the prophet. They also have sacrifices for the souls of the deceased. The Buddhists offer flowers and first-fruits only; their animal sacrifices are represented by small animal figures kneaded of dough, offered up on certain occasions. Of the "classical" peoples and their sacrificial debauches, which followed the primeval frugality in their offerings no less than in their lives, we need not speak here, save as far as they, too, indulged in the rite of human sacrifice from their very earliest period to their decadence. Among the Greeks, the legendary tales of the daughters of Erechtheus, and of Iphigenia in mythical times, the sanctuary of Zeus Laphystius at Halos and at Lycæa, in Arcadia, the offering up of three Persians by Themistocles before the battle of Salamis, are tokens sufficiently indicative of the generality of the practice. Among the Romans, human sacrifices, in use during the republic—either enthusiastic voluntary deeds of patriotism, or simply a kind of execution in punishment of a deadly sin—were prohibited in later times by the senate; but both Augustus and Sextus Pompeius committed wholesale murders by way of political sacrifice to the gods. That this abomination of slaughtering men in honor of God at stated periods, flourished to an awful extent among our northern ancestors—Scandinavians and Germans, as well as among Gauls and other Celts—need hardly be added. At Upsala, every ninth year, a great sacrifice of expiation was offered up, consisting of nine human beings and sixty-three animals. The Danes, in the same manner, held a sacred sacrifice every ninth year, of ninety-nine men, besides horses, dogs, cocks, and other domestic animals (see the EDDAS; Müller, *Sagenbibliothek*; Pertz, *Mon. Germ. Hist.*; *Script. passim*, etc.). The German tribes, even after their conversion to Christianity, continued to offer up their prisoners of war, as of yore, just as the Franks brought their sacrifices both to their ancient gods and to Christ. Any illness, danger, sickness—the slightest inducement, in fact—sufficed to move the Gauls toward a human holocaust, in the fashion of the worshippers of Baal and Moloch. At the death of a man, all his possessions, movable and immovable, including slaves, clients, wives, and all, were offered up to his manes. See SUTTEE. That the ancient Mexicans, the negroes, and other wild tribes, were highly proficient in this sort of wholesale slaughter, need hardly be added: the king of Dahomey's practices, and the fruitless remonstrances of our own government, are a too well-known illustration of the firm hold this kind of murder in honor of the Deity has of the human mind. In conclusion, may we not consider the cruelties and massacres committed upon the Jews in the middle ages, in the name of Christ, as a last offspring of that Moloch or Baal worship which seems to be an instinct in the superstitious mind, whether Pagan or Christian?

SACRILEGE is not now a legal but is a popular term used to denote the breaking into a place of worship, and stealing therefrom. In England, whoever breaks and enters any church, chapel, meeting-house, or other place of divine worship, and commits any felony therein, or whoever, being in such places, shall commit any felony

therein, and break out of the same, is guilty of felony, and liable to penal servitude for life, or for not less than three years, or to imprisonment for a term not exceeding two years, with hard labor. The legal offense comes generally under the head of burglary or house-breaking. A less punishment applies to the offense when committed in dissenting chapels.—In Scotland there is no increase of severity in the punishment by reason of the sacred character of the things stolen.

SACRISTAN (Lat. *sacra*, sacred things), an official attached to a church, who is charged, under the priest or ruler of the church, with the care of the church, and of all its appurtenances. It is his duty to open and close the church, to take care of the sacred vestments and utensils, and to prepare what may be required for public service. In some Roman Catholic churches the sacristan is a clerk in minor orders. The English name sexton is derived from this word.

SACRISTY, an apartment attached to a church, in which are kept the sacred objects used in the public worship, and in which the clergy and other functionaries who take part in the service assemble and prepare for the ceremonies on which they are about to enter. In many foreign churches the sacristy is a spacious and costly building.

SACROBOSCO, JOANNES DE (Anglicè, *John of Holywood*), was an English mathematician of the 13th c., entered the university of Paris in 1221, and afterwards became professor there. He died at Paris in 1256. Sacrobosco was one of the first doctors of the middle ages who made use of the astronomical writings of the Arabians. His treatise, *De Sphæra Mundi*, is merely a paraphrase of a portion of Ptolemy's *Almagest*. No book enjoyed greater renown as a manual among the scholastics. First published in 1472, it passed through more than 20 editions—some even say 65—with as many commentaries. Other works of Sacrobosco are *De Computo Ecclesiastico* and *De Algorithmo*, one of the first works on arithmetic in which the numerical notation of the Arabs is employed.

SACRUM, or Os SACRUM, is a triangular bone situated at the lower part of the vertebral column (of which it is a natural continuation), and wedged between the two innominate bones so as to form the keystone to the pelvic arch. It is readily seen to consist of five vertebræ with their bodies and processes, all consolidated into a single bone. Its anterior surface is concave, not only from above downwards, but also from side to side. The posterior surface is convex, and presents, in the middle vertical line, a crest, formed by the fusion of the spines of the vertebræ, of which the bone is composed. The last sacral vertebra has, however, no spine, and the termination of the vertebral canal is here very slightly protected.

Various reasons have been assigned for the peculiar name given from very olden times to this bone. One of the reasons assigned is that it was the part used in sacrifices. Another reason is based on the view maintained by the Jewish rabbins, who held that this part of the skeleton, which they called "luz," resisted decay, and became the germ from which the body would be raised:

"From whence the learned sons of art
Os sacrum justly call the part."
Butler's *Hudibras*, cant. ii., part iii.

SACS AND FOXES, two tribes of Algonquin Indians living originally around Detroit. The Sacs were driven by the Iroquois to Green bay, where they joined the Foxes. The Sacs sided with the English in the revolutionary war and the war of 1812. They joined Pontiac, while the Foxes remained friendly to the whites. The Sacs and Foxes in 1804 ceded to the United States territory on the Illinois, Fox, Missouri, and Wisconsin rivers. The majority of the tribe was then n. of the Mississippi. A portion of the kindred tribes participated in the Black Hawk war, after which they made further cessions of land. Soon after this they were living around the Des Moines river. They were removed by the treaty of 1842. They have steadily decreased in numbers, and efforts to civilize them have been unsuccessful. A small remnant, probably not more than 80, occupy a reservation in n.e. Kansas and s.e. Nebraska. The remainder, numbering about 450, are near the Red fork of the Arkansas, except a few who settled in Iowa in 1857.

SACY, ANTOINE ISAAC, BARON SILVESTRE DE, one of the most celebrated orientalists, was born at Paris in 1758. After being grounded in the classics, he commenced at the age of 12 the study of Hebrew, to which, as he advanced in years, he added the other branches of Semitic—Syriac, Aramaic, Samaritan, and finally Arabic. Persian and Turkish he acquired still later; but though one of the greatest masters of Arabic and Persian that ever lived, he never made much progress in Turkish. Modern European languages and jurisprudence formed collateral branches of his stupendous acquisitions. From 1781 he held various appointments under government, chiefly in the mint. His first appearance in the world of letters dates from 1780, when he commenced to contribute to Eichhorn's celebrated *Repertorium*. In 1785 he was elected a member of the French academy; and a number of monographs by him followed each other in quick succession in the transactions of this body, chiefly on Arabic and Persian history, literature, and antiquities. In 1793 he published his first great work the *Annales de Mirkhond*, translated, with an extensive commentary, from the Persian. In 1792 he retired from the service of the government, to devote himself exclusively to his favorite

studies; in 1795 he was appointed to a chair in the newly-founded *ecole des langues orientales*; but refusing to take the oath of hatred against royalty, he was not allowed to teach. In 1803, when the institute was completely reorganized, he took his seat there again; and shortly after was nominated professor of Persian at the *collège de France*. In 1808 he became a member of the *corps législatif*, and was subsequently attached to the commission and council of public instruction. In 1822 he was made administrator of the *collège de France* and the *ecole spéciale des langues orientales*; and in the same year he founded, with Abel Rémusat, the *société Asiatique*. Under the new Orleans government, to which he soon attached himself, he was nominated inspector of the oriental type of the oriental printing-office, and perpetual secretary of the *académie des inscriptions*. Yet, with these numerous offices on his shoulders, to all of which he attended most conscientiously, he never for one instant relaxed in his studies; and the number of his essays, memoirs, pamphlets, papers, etc., besides his larger works, is perfectly prodigious. He died, full of years and honors, in 1838, and was buried in the *Père Lachaise*. The academy had a medal struck in his honor, and his bust was placed in the library of the institute. Oriental studies owe to him more, almost, than to any other orientalist of our age. Irrespective of his own brilliant and numerous labors, he furthered and promoted his favorite science in every possible way—founding, or causing to be founded, oriental chairs in France, and forming such disciples as Freitag, Kosegarten, Rasmussen, Chézy, Quatremère, Jaubert, Saint-Martin, and others of more or less eminence as orientalists.

Among his works we would chiefly enumerate his *Grammaire Arabe*, the most classical work of its kind, and which has given Arabic studies an entirely new impulse, forming, as it were, the turning-point between the ancient and modern oriental philology. Next to this stands his *Chrestomathie Arabe*, with the *Anthologie Grammaticale Arabe*. Among his other writings are *Mémoires sur Diverses Antiquités de la Perse*; the translation of Abdollatis's *Egypt*, with notes; his editions of *Calila ve-Dimnah*; of the *Pendúneh*, with a French translation; the *Makamat* of Hariri; his *Mémoires sur l'Etat Actuel des Samaritains*; *Exposé de la Religion des Druses*; and his manifold contributions (above 400 in number) to the *Magasin Encyclopédique*, *Mémoires de l'Institut*, *Recueil de l'Académie des Inscriptions*, *Fundgruben des Orients*, *Annales des Voyages*, *Journal de la Société Asiatique*, *Biographie Universelle*, and Eichhorn's *Repertorium für biblische und orientalische Literatur*, *Revue des Deux Mondes*, etc.

SACY, SAMUEL USTAZADE SILVESTRE DE, son of the foregoing, a journalist, was b. in 1801. In 1828 he became attached to the staff of the *Journal des Débats*, and has ever since remained faithful to its columns. His has been chiefly the polemical part; and it is supposed that, not omitting to take part in almost every public question, he wrote about two-thirds of the political articles that appeared in that paper during the second quarter of the present century. From 1852, when the empire was re-established, he relinquished politics, and became the principal reviewer of the paper. In 1848 he was appointed administrator of the Mazarin library; in 1854 was elected a member of the academy; in 1864 he became a member of the council of education; in 1867 of the senate. In 1858 he published a collection of his literary articles (*Variétés Littéraires, Morales, et Historiques*, 2 vols.). In conjunction with Ed. Thierry and others, he edited *Rapport sur l'état des Lettres et des Sciences* (1868). He also edited a number of religious works, and in 1861-64 an edition of the Letters of Madame de Sévigné in 11 volumes. He died Feb., 1879.

SADDENING, a peculiar method of applying certain mordants in dyeing and printing cloths, so as to give duller shades to the colors employed than those they ordinarily produce.

SADDEBACK, a well-known mountain of Cumberland, $4\frac{1}{2}$ m. n.e. of Keswick, 2,787 ft. high.

SADDLERY. Saddlery is next in importance to human clothing, being essential to the employment of horses, therefore its manufacture is carried on in almost every town and village. England, however, exports large quantities of saddlery, nearly all of which is made at Walsall, in Staffordshire, or in the neighborhood. The value of the exports of saddlery and harness amounts to nearly £400,000 per annum. A saddle consists of the wooden frame or *saddle-tree*, the *skirts* or padded *under-flaps*, the *upper-flaps* and *seat*, which are generally made of tanned pigskin, the *girth* or *belly-band*, the *stirrup-straps*, the *stirrups*, and the *crupper-loop*.

SAD DUCEES (*Zedukim*), a Jewish school or party—not a “sect,” as they have been generally denominated since Josephus—of the times subsequently to the Syrian wars, and often mentioned in the New Testament, the Talmud, and the Midrash. Their origin, as well as their name, has given rise to many speculations and suggestions, but none can be considered satisfactory. Modern investigators have derived the name from Zadikk, righteous man, a denomination which the Sadducees are supposed to have assumed in contradistinction from the Pharisees, the Separatists, as designating their own rejection of all superfluous and exaggerated religious practices, and their stand upon the words of the law itself.

The tenets of the Sadducees are noticed as contrasted with those of the Pharisees (q.v.).

A misconceived notion of some church fathers, to the effect that the Sadducees rejected all the canonical books of the Old Testament, with the sole exception of the Pentateuch, hardly requires refutation. They held the whole of the Old Testament as sacred as the Pharisees, and they quote equally from all its portions in support of their views. They would, if this or any other of those exaggerated accounts of their "unbelief" had any foundation, not have remained in the Sanhedrim, their members would not have been high-priests, and the Pharisees would not have fought against them about mere trifles and casuistically. But, on the other hand, their sober rationalism could not, apart from their aristocratic tendencies, at a time in which the immense struggle for liberty was still fresh in the people's minds, gain for them that popular sympathy which the Pharisees—eager, jealous, patriotic, pious, learned men of the people, enthusiastic men of progress—so easily acquired and held. Thus Sadduceeism, of which we hear so much in the New Testament, and which was combated as "the leaven of Herod" by Christ, while he only inveighs, as does the Talmud, against the hypocrites among the Pharisees, died out soon after the 1st c. A.D. The term under which they are once mentioned in the Mishna, viz., Karaim, became, at a later period, the name of a Jewish sect, still in existence, who reject all tradition, simply holding by the written law as their sole guide. See article JEWISH SECTS. The Talmud speaks of certain writings of the Sadducees, but nothing has survived. A criminal code of theirs, of a somewhat arbitrary nature, is mentioned in *Mes. Taan.* iv.

SÂDI, SHEIKH MUSLIM ADDIN, one of the most celebrated Persian poets, was b. at Shiraz, about the year 1184. Little is known of the circumstances of his life. His father's name was Ablallah, and he was a descendant of Ali, Mohammed's son-in-law; notwithstanding his noble lineage, however, he held but an insignificant position. Sâdi was early left fatherless. He received his education in science and theology at Bagdad, and from here he undertook, together with his master, his first pilgrimage to Mecca; a pilgrimage which he subsequently repeated no less than 14 times. He traveled for a great number of years, and is said to have visited parts of Europe, Barbary, Abyssinia, Egypt, Syria, Palestine, Armenia, Asia Minor, Arabia, Persia, Tartary, Afghanistan, and India. Near Jerusalem, "where," he says, "I associated with the brutes," he was taken prisoner by the crusaders, not while fighting against them, but while practicing religious austerities in the desert. He was ransomed for ten dinars by a merchant of Aleppo, who recognized him, and gave him his daughter in marriage: this union, however, did not prove happy. He married a second time, and lost his only son from that marriage. The latter part of his life Sâdi spent in retirement near his native town, and he died, at a very old age, in 699 H., or 1263 A.D.; according to others, however, he did not die until 1291 or 1293 A.D. In person he is described as having been of rather insignificant appearance, short, slim, and spare, nor is there much to be said for his personal prowess. His was a contemplative, pious, and, so to say, philosophical disposition. The years of his retirement from life he occupied in composing those numerous works which have made him justly famous through east and west. Although European critics would hardly be inclined to indorse to the full the judgment passed upon him by his countrymen, that he was "the most eloquent of writers, the wittiest author of either modern or ancient times, and one of the four monarchs of eloquence and style," yet there is no doubt that this "nightingale of thousand songs" is deservedly held among the foremost masters of poetry, and that he fully merited the honors showered upon him by princes and nobles, both during his lifetime and after his death. A magnificent mausoleum, with a mosque and college attached to it, was erected in his honor at the gates of Shiraz, and the people, who soon wound a halo of legend around his life, flocked thither in pilgrimage; and so carefully is his tomb guarded, that when visited by col. Franklin in 1787, it was in the same state as when Sâdi was buried.

The catalogue of his works comprises 22 different kinds of writings in prose and verse, in Arabic and in Persian, of which *ghazels* and *kassidas* (odes, dirges) form the predominant part. The most celebrated and finished of his works, however, is the *Gulistan*, or rose-garden, a kind of moral work in prose and verse, consisting of eight chapters, on kings, dervishes, contentment, taciturnity, love and youth, decrepitude and old age, education, and the duties of society, the whole intermixed with a number of stories, maxims, philosophical sentences, puns, and the like. Next to this stands the *Bostan*, or tree-garden, a work somewhat similar to the *Gulistan*, but in verse, and of a more religious nature. Third in rank stands the *Pend-Numeh*, or book of instructions. Elegance and simplicity of style and diction form the chief charm of Sâdi's writings. In wit he is not inferior to Horace, with whose writings he, according to one source, may not have been unacquainted, since he is said to have known Latin. The first complete edition of his works, called the *Salt-cellar of Poets*, by Harrington, was published in Calcutta, 1791-95, and has been reprinted since by native presses in India. The *Gulistan*, first edited with a Latin translation by Gentius (Amsterdam, 1651), has been reprinted very frequently, and has been translated into a number of European tongues, into English chiefly by Gladwin, Ross, and Eastwick. The *Bostan* was first published complete in Calcutta, 1828 (Vienna, 1858), and has likewise been translated into other languages.

SADLER, SIR RALPH, 1507-87; b. England; employed by Henry VIII. in the dissolution of the monasteries, and afterward on diplomatic missions to Scotland. He was

knighted for his gallantry at the battle of Pinkie, 1547, and named by the king's will one of 12 councillors to the commission of 16 nobles to whom the government was given. Elizabeth called him to the privy council, and made him jailer of Mary queen of Scots at Tutbury castle.

SADO, a Japanese island, w. of Japan; 40 m. long, with an average breadth of 8 m.; pop. about 125,000. The surface is rugged. The soil is poor. The chief occupation is mining. Gold, silver, copper, and lead are found throughout the island, though not in rich masses.

SADOLE' TO, JACOPO, 1477-1547; b. Italy; ordained to the priesthood, appointed secretary to Leo X., and afterward bishop of Carpentras. Made cardinal, he opposed Calvinism, but with moderation, and interceded with Francis I. for the Waldenses. He published several books on religious subjects.

SADOW'A, a village of n. Bohemia, in Austria, 8 m. n.w. of Königgrätz, 58 m. n.e. of Prague; pop. 105. It is on the Bistritz river, and was the scene of what proved to be the decisive battle of the German-Italian war, sometimes called the battle of Königgrätz. On June 16, 1866, the Prussians entered Saxony, and Bohemia on the 23d. June 28 the whole army had crossed the mountains, and the forces were united under king William I. On July 3d they met the Austrians under Benedek, 400,000 men being engaged; Prussians, 230,000 and 800 guns; Austrians, 185,000, including 30,000 Saxons, with 700 or 800 guns. At 7 A.M. the battle commenced, and continued unabated until 4 P.M., resulting in the complete rout of the Austrians, whose loss was 40,000 killed and wounded, 20,000 prisoners, and 174 guns. The Prussian loss was 10,000; the needle-gun was their efficient weapon.

SAFE-CONDUCT, a passport granted, on honor, to a foe, enabling him to pass where it would otherwise be impossible for him to go with impunity. Safe-conducts are granted in war for the purposes of conference, etc., and to violate the provisions of such a pass has always been esteemed a disgraceful breach of the laws of honor.

SAFED', a small t. of Palestine, in the pashalic of Acre, and in the ancient province of Galilee, stands on a mountain 2,500 ft. high, 12 m. n. of Tiberias. The inhabitants, about 5,000 in number, are engaged in the manufacture of cloth and in dyeing, and the country in the vicinity is largely productive of wine and oil. It is an ardent wish of the Jews to die at Safed, because they believe that the expected Messiah will make it his capital. The Jews possess about thirty synagogues in the town, also a college for instruction in Hebrew and the Talmud. Before 1837 Safed was a handsome town; but in that year it was partly destroyed by an earthquake, and more than 2,000 people were killed.

SAFES, FIRE-PROOF. The manufacture of iron safes for the preservation of money and valuable papers has become one of great importance. The foundation of the plan on which fire-proof safes are still constructed was laid by a Mr. Richard Scott in 1801. Mr. Thomas Milner in 1840 patented a fire-proof safe embodying the same principle, but with some improvements. In 1843 letters-patent were granted to Messrs. Tann for the use of a mixture of pounded alum and gypsum, previously heated and cooled, as a fire-resisting medium placed between two plates of iron, from 3 to 6 in. apart, which together form the wall of the safe. Milner's plan was to fill the jacket formed by the double-plated sides with sawdust, in which were packed a number of small tubes filled with an alkaline solution, and hermetically sealed, or crystals of alum or soda, containing from 40 to 60 per cent of water of crystallization. In case of fire, and the safe becoming heated, the tubes burst, or the crystals melt and saturate the sawdust with water, which becomes steam, and passes into the inner chamber of the safe, and thus protects the contents, if inflammable, from fire for a considerable length of time. Fire-proof safes are still made on the same principle. Messrs. Chubb use a mixture of alum and a mineral substance they procure from abroad. Many of the safes now made are rooms rather than boxes. A safe deposit company has recently been formed in England (the idea originating in the United States); and in 1875 there was completed in London a large building, in the highest degree proof against fire or thieves, containing about 10,000 safes, which are let out to the public.—See *Protection from Fire and Thieves*, by G. H. Chubb, 1875.

SAFETY-CAGE. See MINING.

SAFETY-FUSE, a species of fuse invented by Messrs. Bickford for use in the Cornish mines, and now generally employed in the chief mining districts, consists of a hollow cord of spun yarn or hemp, tarred on the outside to render it waterproof, and filled with tightly-rammed gunpowder. This fuse ignites steadily at the rate of about 2 ft. per minute, so that the time of the explosion can be easily regulated. The use of this contrivance has contributed to prevent those accidents arising from premature explosions, formerly of very common occurrence in mines. The fuse-tube is sometimes made of gutta-percha.
